# 11379. [FT100] Re: various mics for FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-01 03:30:21 UTC
From: Howard Cunningham
Topic: 11356  Message: 11379

Hi

I run two different Heil mics, the BM10-5 headset and the HM10-5 Desk Mic. I have recieved good audio with both as well as the factory DTMF mic.

The impedance mis-match could be the problem but I don't think a resistive matching "L network" will buy me much since it's going to be quite lossy. Maybe I'll try a transformer. I guess what you're saying is that the D-104 is a relatively high-Z so it gets loaded down by the lower input impedance of the FT-100D mic input port so much that it can't develop a useful voltage. Plus any input shunt capacitance will greatly roll off the the highs, thereby resulting in the heavy bass quality sound. I just can't believe someone else hasn't been through all this with the FT-100D and found a decent mic solution. I almost bought the Heil mic but skipped it after reading several negative reports. Per your other message, I bought the Heil RJ to 8 pin adapter. Also made an 8 pin to 4 pin adapter cable for the D-104. Looks like it won't be a simple appliance repair - going to have to design it properly. The spec in the 100D manual calls for mics with impedances running from, I believe, 2K all the way up to 20K. The D104 must be well above 20K, perhaps 100K? I'll open it up and hopefully find some impedance options. Don't know if it's a ceramic or crystal element, but I suspect it's crystal. What I do know is it works great with the TS-520.

# 11380. Re: FT100 & digital modes

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-01 07:08:10 UTC
From: joates_48323
Topic: 11363  Message: 11380

Hi Kevin,

I use a Rigblaster Nomic with my FT-100D into a Compaq laptop, but only on PSK-31. Any Rigblaster purchased since about the middle of September should have all of the cables included.

To receive signals on PSK-31 ( and I assume on other digital modes) plug an audio cable with two mini stereo plugs with one end in the external speaker jack of the FT-100D and the other into the Mic jack on the laptop. You only need a little bit of volume. To receive, all you need is one audio cable, you do not need the Rigblaster at all.

An important detail if you are doing PSK is NOT to put the FT-100D in a digital mode: use USB.

You also need a software program such as WinPSKse, Digipan or some other program which you can download for free.

BTW, if you use the Rigblaster for transmitting, make sure you install the jumpers correctly.

Hope this helps.

Regards,

Joe -KB8BO

Also,

# 11381. Re: [FT100] Crowbar Protection for Overvoltage Protection...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-01 03:56:37 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 11371  Message: 11381

Well maybe if the controller lost its voltage feedback or its internal reference the output of the switching supply could go wild. Most of the time in a linear supply the output goes wild because the power transistors weren't proper connected to their heat sink, then they overheated, and melted into short circuits. In order to try to balance the currents amongst multiple paralleled pass transistors, they have to use emitter resistors to drop more than half a volt each. Which puts the minimum unregulated voltage generally 4 to 6 volts above the output voltage and that's what shows on the power supply output when the pass transistors short. Hence the desire for crowbar protection. The typical crowbar circuit consists of a zener diode, a resistor, and a power SCR. The resistor is connected from SCR gate to cathode, the zener diode from SCR gate to output voltage, the SCR cathode to the negative output, the SCR anode to the positive output, or sometimes the output of the filter capacitor. Sometimes there's a fuse for the SCR to blow to shut down the output. Its a juggling act to select the zener voltage. Get it too close to the output voltage and the crowbar is too touchy. Get it too high and the radios fry before the crowbar does its thing. Sometimes theres a capacitor across the gate resistor because one of the failings of the simple zener and SCR crowbar is that it can be triggered by stray RF. That makes it unfriendly. There ought to be some resistance in series with the zener diode so a rapidly rising output doesn't melt the zener diode or the SCR gate. Often the SCR in the crowbar is presumed to effectively short and reduce its power dissipation rapidly so that its not mounted on a heat sink, but it probably needs at least 50 amp rating for a 25 amp supply because its going to have to discharge the filter capacitors rapidly and then blow some fuse that only blows fast with current twice its continuous rating.

There is a pass transistor in the switching supply, its turned on and off rapidly by the controller. If the pass/switching transistor shorts, most of the time there's no output at all because DC doesn't pass through its high frequency transformer. Hence that most common failure mode of the linear supply is a safe condition in the switching supply. The failure that can cause radio grief is a loss of voltage feedback. Voltage feedback typically uses a programmable zener like a TL-431C (it would be a super trigger zener for the SCR in a crowbar too) and an optical coupler for isolation. The parts in the voltage feedback circuit aren't stressed with heat and so their life is long.

I get around the need for a crowbar in my shack supply by making the unloaded unregulated voltage only 16 volts and use power MOSFETs for my series regulator which drastically reduces the power dissipation and the heat stress of those regulator transistors. Runs 24/7 supporting my packet node, my packet station and the rest of my ham shack. And its

efficiency is very high while its noise is not detectable.

I found this on www.randl.com at the following URL:

http://www.randl.com/cgi-
local/shop.pl/SID=300215276345/page=results.html

FT100DSM SERVICE MANUAL FOR FT100D E08989003
FT100DSM YAESU PARTS
$ 29.95

I am not sure if they stock it or not. You might want to call them
a call on Jan 2, 2000. I did not find the service manual listed on
AES, and I did not look at any other ham dealer web sites.

Hi, all the power connections are clean.

When I had the problem the first time, I thought maybe the radio became to cold in the car during winter. I took it out and used it in the house.
Then it worked fine for a time, but after I hade the problem again. So it has nothing to do with the temperature.

See you - Luc -

Hi,

Hmmm yes that's exactly what I'm afraid about. If I send it to yaesu I'm sure the radio will work proper that time and they are going to send it back to me
without fixing it. I guess I have to wait until it will not switch on at all any more :-(

Perhaps the firmware of the FT100 is by Microsoft!

I have had the same problem and sent it back to Cerritos when I first got the
radio. They said nothing wrong and my screen still does it. Sometimes it

takes several days before it works again. Fortunately for me, my interest in
ham is at a low ebb right now or I would be packing it up again.

I have had the same problem with my FT-100 for the last month or so (go off, I would wiggle cables, reconnect PS and it would be OK until next time, usually every coupla days or so). It finally wouldn't come back on even after connecting 12 VDCdirectly to the DC connector (thus bypassing fuses, etc.). The screen would flash blue, the PS would draw 5A momentarily and then nothing. My neighbor suggested opening the radio and re-seating all the connections, I did that and also made sure the ground screws were tight. When I reconnected, it now works fine, at least for almost a week now. You might try that or if you find the problem, Please let me know or list it here. Thanks.

# 11391. NEW PROJECT allows you to use the TUN menu-function of the FT-100(D) for your HY-Gain screwdriver antenna or ATU!!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-01 20:07:06 UTC
From: Ham_Tech@juno.com
Topic: 11391  Message: 11391

Greetings to all!!

I have many questions to ask and a preposition to offer as discussion.

First of all I do not have the FT-100(D). Second I would need some guys or gals from the group to have a bit of time to answer my questions.

I am planning to start a project for the benefit of the operator and his FT-100(D), this might have already been done, but I myself have never accomplished such a thing. I am a beginner in electronics, and studying for the highest degree if possible, but not too high. I want to be a radio technician and also an electrical engineer, (one who gets the ideas for building the schematic, and actually makes it work).

College, the second semester, is starting January 7th for me, and I just turned 20 years old, and I hope to do better this semester at doing my homework. So in light of the later, I will be slow as a turtle in getting this project done. I myself do not care about patenting my work at this time, but I would like to offer my research and studies as freeware/shareware for the group or anyone else. I would encourage the reader, to dive into this with me if they want to, or just think about the logic of it. And I encourage the reader to add or subtract from this future project whatever they would like. But if you would like to post it on your homepage, if it has not already been done, please at least put my callsign and first and last name under the picture(s). Which are: KG4DNI; Daniel Brinneman.

NOW ENOUGH WITH THE BABBLE...

Here is the basic purpose of this future project:
It will allow the FT-100(D) TUN menu-driven Ctrl to tune any other Screwdriver antenna that takes RF separately from DC (polarity changes to make screwdriver to go UP or DWN); or ; allow the TUN menu-driven Ctrl to automatically provide the 10W carrier to activate the Auto Tuner.
---
---
---
---
---
---
NO OFFENSE TO ANYONE...
I enjoy setting goals that are challenging to the human brain; like some folks like me, that don't think in electronics, but want something to be proud of if he/she can accomplish it; which will help others to have an easier time using the radio, and will be able to build the project

themselves and add extra "bells and whistles"!!
---
---
---
---
---
---
Questions:

1. What happens at the output of the HF SO-239 when the ATAS-100 is selected in the menus, when you go to transmit?? Could someone check the DC voltage, and what current it is putting out??

2. When the ATAS-100 is enabled, then the TUN menu function works. When ATAS-100 is disabled, does the TUN menu function still work??

3. When the ATAS-100 is disabled, does the HF SO-239 put out RF and DC or just RF??

4. Can someone send me a picture or PDF document of the ATAS-100 schematics, I need to know what kind of chips to use, from looking at the ATAS-100??

5. I would also like to have a PDF document for the schematics of the FT-100(D)!!

Thank you very much for all your help!!

Daniel

The FT-100D does not come with an AM filter installed by the factory.
However, Yaesu - or some Yaesu dealers - may be offering it as a promotion.
You will need the AM filter for best AM operation (RX and TX).

Good choice on the FT-100D for mobile operation! The noise blanker and DSP
are excellent!

Good luck and 73,

From: k6rcx
Topic: 11363  Message: 11393

Kevin and the rest of the group with FT100 data connection questions.
Have you seen the "Rascal" R-FTMDIN at
http://www.packetradio.com/psk31.htm#YAESU
It is a simple connection / isolator box kit that will connect the FT100 DIN I/O data port to a sound card interface. It goes in the DIN data interface port, you don't have to do any thing to the mike or speaker ports. You pick up the mike and it works audio modes. The speaker is still there, turned it down if you don't want to listen to that digital noise, turn up the audio and do FM, SSB or AM. The sound card sees constant audio levels. The FT100 does the switching when it sees PTT on mike or data port. I used the line level in and out ports on the sound card. (you may need to pull the sound card to speaker plug to keep the transmit PSK tones quite) The radio sees constant levels. I most be missing soomthing since i just put it all together in the last day or 2 for PSK31 and it all works great???
If you want to run Packet run the sound card S/W with the same interface or pull the DIN data plug and put in the DIN that ties the FT100 to the hardware Packet modum. That also works great into the DIN data port. Why screw with the mike and speaker port of the FT100 ????
PS - Rigblaster should work the same way. you just have to buy a DIN plug for the FT100 end and sort the connections?? Look at the site listed above. he has all the pinouts listed or read the FT100 owners manual, it has the DIN wiring in the first couple of pages.

From: k6rcx
Topic: 11363  Message: 11394

PS - The hardest part of making the sound card to FT100 work was
bring up the right sound card software interface panel to get the
line Input and Output ports alive. In my case it was a "mixer panel",
which was NOT the panel the PSK31 software i'm using brought up for
level control. I had to dig through the collection of audio control
S/W to find it and keep trying all the 'mute' controls till it worked.

Thanks for the good advice. What I may do here is design a simple op-amp pre-amp for the D-104; just a very few dB gain, if that. Mainly it will provide a low impedance driver. I know I can make that mic work. I get excellent reports on the Kenwood TS-520 with the D-104. Thanks es 73's in the new year.

Federico,
I would like to try out the new CAT software you are developing for
the FT 100. I get my CT 62 cable Friday and will be trying out a
couple of the other CAT software such as CATsPAW and CAT 100 both to
get a feel for CAT. I have never had a rig that could be used in
this manner (only a ham for just over 2 years FT 100 is my first HF
rig) and I understand taht it is not my best choice for CAT. This
was not even a consideration in the purchase of the rig so this will
be quite the experience for me.
73 and All the Best to you and yours

David,
You use the external speaker jack for that. You can use the data jack next to that, data in is pin 1 and grnd is pin 2. you can use the 6 pin mini din plug from an old brain dead mouse. You might have to use the external casing of the plug forground in the case of a mouse plug because in most cases pin 2 is not used on that. By the way pin 1 is the top left and pin 2 is the top right. Here is a basic drawing straight from the book.
1 2
@ @
3 @ @4
5 @l@6
1 data in (audio in)
2 ground
3 PTT
4 Data out 9600 baud
5 Data out 1200 Buad(audio out for PSK and the other SC digital modes)
6 Squelch
I thought I might include the whole works in case ya decided to build a SC Digital interface such as for PSK, HELL, ect
73 and all the best to you and yours

Hi, this is federico, xe2nlm

my cat software free for everyone:
http://groups.yahoo.com/group/FT100/files/

set comm attached to the ft-100d and max speed to 4800

and the photos of the circuit thermal sensor :
http://photos.groups.yahoo.com/group/FT100/lst

it is working great (thermal circuit)

# 11410. Re: [FT100] Re: various mics for FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-02 18:34:46 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 11356  Message: 11410

In private e-mail, Paul Manuel <k4pdm@...> reports that the audio ALC in the DSP of the FT-100 tends to work with the sibilant components outside the transmit SSB filter pass band and to limit output way below that of a flatter microphone. You may find the D-104 (that was designed for AM in the late 30s to compensate for receivers with round shouldered pass bands) will need a preamp with a low pass filter rolling off about 2.7 kHz, at that point you might as well use some Heil. My D-104 case holds a Shure R-5 communications element with limited pass band and works much better than the D-104 can ever work in its original form.

The high frequency response peak of the D-104 also gave trouble with Collins S-line because those high frequency components outside the filter pass band tended to over drive the audio stages and probably the balanced modulator.

Kevin and Ervin: please let me know if the speaker turn off when the
conector on the paquet conector of the ft-100d is pluged in?

in mine, the speaker turn off, and only came sound out of the pin on the din
conector, when the mode of the radio is fm or digital,

could you please check it for me?

regards
federico

# 11412. Re: [FT100] ATAS -100 Mobile Mount- Mag Mount Connector???

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-02 20:47:00 UTC
From: Lee Boulineau
Topic: 11354  Message: 11412

One old trick I have used is to place a couple of
drops of clear nail polish at the junction of the
antenna and the mount - a little elbow grease will
allow you to remove the antenna, and it won't come
loose unless you really pound the heck out of your
antenna and mount!!

> See you - Luc - LX1IQ

I suspect a few problems that you can look at, all of em I have
been thru:

1. Make sure the rig is getting all of the power it can get. If the
current is too low, the radio will not turn on. I had the fuse
holders fail on mine, they looked great but were totally messed up
inside (where you cant inspect it). The end result was a flash from
the radio display but no talky... Cut em off and install the gold
plated auto sound style fuses and eliminate this abomination.
2. If its in the cold as mine always is (right now at least), it
takes longer to cycle on as the cpu runs slower in the cold. I
sometimes have to hold in the button approx 1/2 second to get it to
cycle on in the cold as the cpu looks for the switch state slower in
the cold than in nicer weather.
3. I suspect this switch get dirty after a while making it tougher to
turn on after a while. Its prob one of those square pcb mount types
with the black or white nub sticking out of it. They are notorious
for being finicky after a few hundred cycles. Mine is fine but I can
tell it takes more pressure after 2.5 years of use.

Regards.. Richy N2ZD

# 11416. Transmit in whole 6 m band

Yahoo group: FT100 (2002-01 — 2002-06)

I opened up the stock mic at one point but found that the mic element is pressed into its own cylindrical housing and not easily removed. Guess it actually is easily removed since you managed to do it. Tell me more about getting it out. I think it's held in place by some rubber material possibly. Of course I must remove it before I can drill out the 3rd hole and twist the "baffle" around.
Thanks for any suggestions.

Boy that's a new one. My FT-100D has always transmitted from 50.0 to 54.0 MHz. That's the basic product spec - without any special mods. Don't know what to tell ya unless it's set up for repeater operation and so then attempting to transmit out of band. Confirm that the RPT function is off.

federico,
on my FT100, using the DIN data port for digital interface, the the normal speaker audio output connector stays active. I can adjust the volume and monitor the digital audio in the background, if i want.

Folks, No matter what type of mic I use, reports with this rig are poor ! I?ve tried all sort of mics (Yaesu, Shure, Heil, Drake, Astatic etc...) and seems that audio is not the best point. This rig was designed to be pratical, but I can record any QSO in any band, using any mic and send through this net to everybody. What about setting a UTC time and band and test our rigs "on the air" ??? 73?s --- backhoefade wrote: I opened up the stock mic at one point but found that the mic element

Well, the FT-100D has been at the Yeasu hospital in Cerritas for the "mod's" since 12-18-2001. I UPS'ed the unit in on the 11th. Today they told me not to expect the unit back until at least the end of this month. The holidays and several power outages have slowed the turn around time down. Anyone sending a unit in now should not expect a return for 6/7 weeks. I was originally told I could expect a 30 day turn around...Paul, KD5KCZ

> is selected in the menus, when you go to transmit?? Could someone
> check the DC voltage, and what current it is putting out??
A=Amcom offers an external tuner for the ATAS-100 so it can be used with
other radios. You can see it at:

http://www.amcominc.com/productdetail.cfm?Prod_ID=85

According to the values of the voltage divider circuits shown in the
technical supplement +8.4V applied to the coax causes the ATAS-100 to
retract, and +10.4V or more will cause it to extend.

>
> 2. When the ATAS-100 is enabled, then the TUN menu function works.
> When ATAS-100 is disabled, does the TUN menu function still work??
>
no, until the q7019in the cntrl unit switch to on, then the voltage needed
for the atas 100 up/dn make the adjustment and then the swr=or aprox1.0
then the voltage return to 0vdc

> 3. When the ATAS-100 is disabled, does the HF SO-239 put out RF

# 11427. Explanation on "TUN menu-driven ctrl box"

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 01:16:05 UTC
From: Ham_Tech@juno.com
Topic: 11427  Message: 11427

Greetings to all,

The circuitry I am planning to design for use by the FT-100(D):

--->If the first statement is correct, then the second statement; in the form of an explanation; will be my answer!!<---
---
FIRST STATEMENT

Currently most operators have the capability to use the ATAS-100 as their antenna. When the ATAS-100 is used, the operator can tune it using the internal commands from the FT-100(D), to activate the remote tuning unit in the ATAS-100. If the FT-100(D)'s operator decides to use another antenna, like the one designed for 80 meters through 6 meters by Hy-Gain, then the operator must not select the ATAS-100 in the menu; thus allowing only RF out through the HF SO-239; and use of an external DPDT Momentary Contact switch to control the polarity provided by the car's battery, to adjust the commercial screwdriver antenna; with reference to either an MFJ SWR Analyzer or the SWR scale on the FT-100(D) display. If the FT-100(D) operator is using an external automatic antenna tuner (ATU), then he/she must have the radio provide at least a 10W carrier, while in a different mode or band. No offense here, but this action requires an external circuit AND an external push button to activate the circuit; which then talks to the radio through the CAT (?) port.

SECOND STATEMENT

Both of the examples above, require an external source or action to function, AND the use of the internal menus for the original purpose of tuning the ATAS-100 can not be used for any other antenna, self the later.

**********
***So in speaking to the group, I am not an electrical engineer, but a student in college. To pass my "Digital Electronics" class, I had to construct a security keypad entering device with a code, for my final exam. I was so excited after 4 weeks of research and missing sleep, when I finally had it over with. I received an A+ with a excellent report which I turned in to my Electronics teacher, George Kouvaris, and also the approval of the circuit laid out on the breadboard. Now I want to build another circuit, off of the design concepts of the ATAS-100 Remote Unit schematic, with more creative thinking put into it. I have neither radio nor antenna, and school is around the corner (as soon as the snow wants to melt) so I won't have much time to put into building this project. I enjoy challenges, that my mind at that split second doubts it can fathom.***

**********

I want to build onto the schematic of the 'remote unit' in the ATAS-100 so that its circuitry can be used for other purposes. I do not want to use the ATAS-100 on another radio. I want to be able to allow the operator a chance at allowing he/she to use the internal tune (TUN) commands; of the FT-100(D); to control other forms of screwdriver antennas or an automatic antenna tuner (ATU). I myself want to have the challenge of building the circuit, and then allow others to expand on my ideas. I want to make most of the part accessible through Radio Shack, but yet some of the parts such as the inductors, might have to be ordered from Yaesu. There might be one external switch to change between the screwdriver or ATU mode of operation. If I ever have this to work, and you would like to post it on your home page, please at least put my call sign, and my first and last name.

---

I hope I have explained it to your understanding!!

Daniel
kg4dni

PS. If you want to see what I look like, go to qrz's detailed info on my call sign.

I for one would love to have something to tune my Hi-Q Stealth 2000. But one issue I see is that if you set the tune menu to ATAS-1 or 2 it disables the TX below 7 Mhz.

# 11429. Re: Deaf RX

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 05:16:23 UTC
From: georgeah6bv
Topic: 9915  Message: 11429

I just purchased a used FT-100, sn 0J..... that has the same symptoms. I practically took my coax patch cords and switches apart thinking I had a faulty connection. Same thing - S9 signals drop to S1 within a minute. Powering it off and on restores the RX sensitivity temporarily before it dies down. This is true for HF and 2M - only because I had no 6M or 430 sigs to monitor, and I was toggling A/B VFOs.

I removed the top cover and it seemed to cure the problem - seems to be thermal in nature. I borrowed the XYL's hair dryer with hot/normal air capability and did some hot/cold troubleshooting.

Found that the suspect component or condition is in the LPF board centered between the large black relay that the two coax leads connect to, and the ribbon cable. I tuned to strong signals on 20M and 2M and actually made the condition appear and disappear by heating and cooling that aarea of the LPF board.

Examination of the affected area in the LPF board shows that there is one resistor glued to the top of an IC chip which could be a temperature sensor?

I removed the 5 screws holding the LPF board to the chassis, applied De-Oxit to the screw lips and board's solder layered screwholes, thinking maybe board expansion was leading to less than optimal grounding. It seemed to do the trick - signals stayed at normal levels longer than before - almost half-an-hour. Once it dropped, it was back to the same old symptoms.

So... it may be that a grounding scheme for LPF board (to compensate for expansion diff) may do the trick. Or it may be the resistor?

I've given up for today. I put the radio back together. I have a little fan blowing onto the top cover rear vents. The radio RX has been operating normally. Just that instead of an internal fan mod, I have an external fan mod ;-)

# 11430. Re: ATAS-100 stinger length??? (Can you add a longer one???)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 05:46:59 UTC
From: nb6i
Topic: 11414  Message: 11430

I have tried using a longer stinger as well as a thicker stinger of the same length with the ATAS-100.

The thicker whip helps keep the antenna more erect at highway speed compated to the factory stinger. Looks nicer to the eye but it does not help improve transmission or reception.

The longer stinger does help the antenna tune down into 40 meters when installed with a less than ideal ground but you lose the ability to reach into 6 meters. No discernable advantage in transmission or reception here either.

In the end, the best thing to do with the ATAS-100 is leave the stinger alone and concentrate your hardware work on the other half of the vertical antenna. The counterpoise or ground plane. The ATAS-100 is a vertical antenna just like any other and it needs either a ground plane or a good capacitive coupling to the car body to work effectively.

A set of resonant length wires connected to the ground side at the mount is heaven to these antennas and it does improve reception and transmission performance. I have mine wrapped around a Yakima roof rack on top of my roof. Tuning stubs and a capacitive coupling plane ... who could ask for more. The most important ones as you might expect are 1/4 wavelength wires for 40, 20, 15 and 10 meters plus a short 1 foot wire to ground to the car roof. Yes it is an exercise in creative geometry to install a 32'9" (7.150Mhz) wire on your car roof.

Note: That short wire is important because the ATAS-100 needs a DC reference point to faithfully detect the 8 volt and 12 volt signals coming from the FT-100 to tell it what direction to move. It's also a good idea to ground the radio case to the car body with a similar short piece of wire at that end.

Also, using strong medicine tricks normally used in base stations can prove useful in mobiles. Putting a RadioWorks T-4 line isolator in the coax train helps keep feedback current coming back down the coax braid. Mobile installations are often picky and interrupting that current can help keep the FT-100 happier. The isolator should be added AFTER installing counterpoise wires. It only helps. It does not replace basic vertical antenna design requirements.

Oh. Watch the length of your coax run. Make sure you haven't created any high impedance conditions. The FT-100+ATAS will complain about such a mistake. Given the choice, I'd recommend you err on the long side and make a few more loops in your coil. Better

for cutting off a bad connector and replacing it later.

Given all that, I still like putting a thicker or longer stinger on the antenna. It looks cool and your friends notice when you pull up to have coffee.

****

I have not experimented with a really long stinger and a manual up/down switch to get the ATAS-100 to run resonant on 80 meters. I suppose it's possible and the little control boxes are in good supply these days. It'd be a stationary op thing at best. I doubt the antenna is beefy enough to take that much wind load not to mention whacking every tree in town. If you decide to do it I'd recommend having an SWR meter in line instead of relying on the SWR bars in the radio display.

Also remember the FT-100 does not auto-tune or transmit on 80 or 160 meters in settings ATAS-1/2 so it's a manual set up at best. You do not want to be toggling between ATAS off and 1. The radio does it's initial tune thing which moves the antenna and there goes your hard work.

****

I did experiment with driving into my garage with the ATAS-100 still erected. The ATAS lost. Garage doors are stronger. Fortunately for me I live in grid square DM03. The drive to the Yaesu building in Cerritos takes about 20 minutes. They're very nice people.

I have 2 ATAS antennas in case I make the mistake of attempting a rematch.

> rubber material possibly. Of course I must remove it before I can
> drill out the 3rd hole and twist the "baffle" around.
> Thanks for any suggestions.
> Chas N6AF

I dont recall any glue or adhesive holding it in. Its pressed in from what I remember. Once you pull it out, you will find a disc in front of the element, note its orientation and after you make the hole, you will see that the disc can be rotated slightly to allow more of the front of the element to be exposed to the three holes. Not much, but enough to make it work better.. Regards.. Richy N2ZD

# 11433. RE: Files

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 16:35:02 UTC
From: Terry
Topic: 11433  Message: 11433

Hi all,

I located the files page and completed the SWR mod yesterday. I have an extended stinger on my ATAS-100 (12" longer) and now with the mod I am able to tune 10 and 6 meters with no problem. Before doing the mod I rarely was able to tune up on 10 or 6. A great radio just became even better!

I asked for the VHF/UHF fan mod and the grounding problem mod. For the past week I have tried to contact Yaesu and could not even get them to answer the phone (562-404-2700) until yesterday. It seems they have experienced a series of electrical blackouts in the area over the last 30/45 days. I don't think I would want to live in a place where you couldn't depend on electricity. As of yesterday, my radio had not been assigned to a tech. I am finding out that several of the current Yaesu products are having the "grounding problem". Hopefully, Yaesu won't end up being the "Firestone" of amateur radio with "AOL" service....Paul

# 11436. Re: [FT100] Re: Deaf RX

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 18:09:39 UTC
From: John Hirth
Topic: 9915  Message: 11436

George, Brett and all:

Very good localization troubleshooting, George. My 100D is now back at Yaesu in California for EXACTLY this problem.

Actually, I sent it there originally for both this problem and the VHF thermal mod, but when it came back the mod was done but this sensitivity problem was still there. So I contacted John Lynn, Customer Service Manager directly. He told me to send it back again with a letter describing our phone conversation and he'd get someone right on it, since the problem wasn't fixed the first time (after sitting in their queue for 5 weeks).

When I get it back with the problem fixed, I'll look at the invoice and tell the list what components were replaced.

Sure wish I could just hop back and forth to Cerritos, but the one week ship time each way from NY is a drag.

73 to all, and Happy New Year.

The circuitry you seek is doable.

What you want to do is two things.

1. Extract the 8v/12v DC signals from the FT-100 coax. Take a look at the SGC coax/DC isolator for an example on the principle. There are homebrew examples of this type of gizmo floating around as well.

2. Then you need a circuit that takes the 8v/12v/0v signals and converts them into the signals (and amperage levels) needed by another screwdriver design. These are probably direct drive to the stepper motor designs using +12v/-12v/0v signals. Note that the 0v case is important. That means "don't move". A proper design positively detects and implements all three conditions. On the FT-100 side I'd recommend declaring any voltage less than 5v as the OFF/STOP logic level.

Caveat: FT-100's do not autotune below 7Mhz. So this circuit will be unable to reach down into the 80/160 capabilities of a larger screwdriver.

Personally, it's easier and more flexible to use a manual up/down box with another antenna. But I agree it makes for a nice theoretical design project.

# 11439. Measuring TX audio response

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-04 19:24:14 UTC
From: backhoefade
Topic: 11439  Message: 11439

In order to eliminate some of the mystery and guess-work associated with the FT-100D and its often-criticized transmit audio "quality", I intend to measure the effective frequency response from the mic input to the RF output. In other words I will drive the input with a sinusoid of a defined level (confirmed low enough to ensure no compression) and then measure the RF emission (a single sinusoidal side-band). I'll choose different driving impedances to emulate different mic impedances. Then at least we will have a clear picture of the overall frequency response of the "audio-to-RF channel" in the transmitter. Beyond that we are subject to microphone frequency response and interface effects (mis-match leading to reduced level and/or non-flat frequency response). Viewing the basic response will be a good starting point.

I think there is a design in the files link of this group. And to get around the Below 7Mhz stuff there is a manual switch to help with that.

Subject: [FT100] Re: Explanation on "TUN menu-driven ctrl box"

The circuitry you seek is doable.

What you want to do is two things.

1. Extract the 8v/12v DC signals from the FT-100 coax. Take a look at the SGC coax/DC isolator for an example on the principle. There are homebrew examples of this type of gizmo floating around as well.

2. Then you need a circuit that takes the 8v/12v/0v signals and converts them into the signals (and amperage levels) needed by another screwdriver design. These are probably direct drive to the stepper motor designs using +12v/-12v/0v signals. Note that the 0v case is important. That means "don't move". A proper design positively detects and implements all three conditions. On the FT-100 side I'd recommend declaring any voltage less than 5v as the OFF/STOP logic level.

Caveat: FT-100's do not autotune below 7Mhz. So this circuit will be unable to reach down into the 80/160 capabilities of a larger screwdriver.

Personally, it's easier and more flexible to use a manual up/down box with another antenna. But I agree it makes for a nice theoretical design project.

The only way around the Tuning below 7 MHz deal is to go into the menu and turn off ATAS 1 or 2 and then you can use 80 or 160 meters but youll need a tuner.

George, Brett and all:

Very good localization troubleshooting, George. My 100D is now back at
Yaesu in California for EXACTLY this problem.

Actually, I sent it there originally for both this problem and the VHF
thermal mod, but when it came back the mod was done but this sensitivity
problem was still there. So I contacted John Lynn, Customer Service
Manager directly. He told me to send it back again with a letter
describing our phone conversation and he'd get someone right on it,
since the problem wasn't fixed the first time (after sitting in their
queue for 5 weeks).

When I get it back with the problem fixed, I'll look at the invoice and
tell the list what components were replaced.

Sure wish I could just hop back and forth to Cerritos, but the one week
ship time each way from NY is a drag.

73 to all, and Happy New Year.

From: Federico Batarse
Topic: 11443  Message: 11443

hi, this is federicobatarse, xe2nlm, in mexico, and i think i now who this thing work.

1.- two voltage ( both dc,) one for up and one for down( i think 8.9 for up and 6.0 for down) on the coax cable.

2.- the ft-100 and the ft-847 have a procesor to tell the unit (atas 100) move up or down. and found the swr lower for the desired frequency, and then if the user move the frequency the microprocesor tell the atas 100( by the meaning of the voltage) to go down or go up. and then found again the lowest swr for this new frequency.

the microprocesor can advice the movements or cancel if the atas is no conected.

regards and 73

Hi Chas,

I think this will be a good experiment. I generally get good audio reports on my rig and I've talked with others with FT100s who sound fine. However, there have been those who have found that they needed to change mics to get good audio reports and those who can't get a decent audio report no matter what they try.

The only thing I can think of is that the RF is getting back into the mic during transmit and causing some kind of distortion. It's not apparent what kind of distortion is being caused because there is no quantitative way to explain how the audio is distorted. So I think that putting a pure sine wave into the mic would be the first step in finding out what's happening. However, if the rig already has

good audio, then it may not yield any results that would help us to understand what is wrong with the rigs that have the 'poor audio' issue.

If it is RF getting back into the mic,(picked up on the mic cable), then there are a few things that can be done to help isolate that problem.

The first would be to reduce power or the RF field around the rig to see the audio distortion changes. This could be done simply by backing down the power output or by connecting to an antenna that is far away from the rig. The RF fields around mobile rigs tend to be quite large, even if they are considered 'safe' by FCC limits, because the antenna tends to be just a few feet away.

Another experiment would be to wrap the mic cord around a ferrite a few times to see if that helps. If it is RF getting into the audio circuit, it will have more trouble getting through a ferrite whereas the audio frequencies will get through without a problem.

These are easy experiments to try and might help isolate the issue for those who have the problem.

Hi Lee and the rest of the group.

I think that the biggest problem is the supply power. If the radio ISN'T running at 13.8 volts, then this is a VERY good place to have the audio messed up. A good test of this is turn your engine off while talking to some one and ask them what your audio sounds like. This might take about 15 minutes before the audio starts to go. You have to wait for the battery to loose it's float charge. The radio is DESIGNED to run at 13.8. Any less and you are taking a chance to have problems.

The other thing that people do is run the mic setting WAY too high. I run my mic gain (menu 25) at 40 and this was checked on a service monitor to be about the best setting for it. Most everyone in my area is using the same settings with VERY good audio results. menu 26 is set to 45 and that is even a bit hot when the windows are open. I do not need to use the comp and that is something else that I have not seen people say. We would need to know what their settings are and what they are using for supply voltage.

When people say they are having a problem, they need to give us some menu settings so they can be looked at. I will put my settings that I use for audio in this message for all to look at and try.

MENU:
25, 40

26, 45
27, 40
33, 5
62, +050
63, +050
64, -200
65, -200

These settings were done by a friend of mine on a service monitor after MANY hours of playing to get the best sound that he could get out of the radio. His voice has a higher tone than mine and the same settings work for both of us and many others in my area. Please look at your settings and give these a try and see if it makes a difference.

The other thing, like I said before is the voltage. The radio wants 13.8 volts (this was also looked at with higher and lower voltages). Make sure that you are running both the positive and negative leads direct to the battery and that you have the radio WELL grounded.

Well this is enough for now.
If anyone would like a copy of exactly what my settings are, I would be more than happy to post them here for all to play with.

I'm testing for my ticket in the next few days..
As I'm in a rural area away from repeaters, I'm looking at my first rig to be the FT-100 vs a HT. My drive to work is about an hour through mostly rural area too - a good opportunity to DX?
It's obviously lots more money, but I figure that why be unhappy with a low power HT and not hit the repeaters when you can have the whole shebang!

Comments anyone?

Kevin

Hi,

I have had an FT-100 in my car now for over two years.

I programmed the beginning band edge frequencies into sequential memory locations. This allows me to tune to a new band by simply pressing the one button on the front panel. Once on the band I want I use the buttons on the top of the microphone to run up or down the band. This makes it very easy to scan for any stations DX or otherwise.

I also use the ATAS-100 antenna so tuning again only takes the push of one button.

All of this makes using the system mobile very easy and I have worked many DX stations as well as stations in the U.S.

Hi Kevin,

I think the FT-100D would be a good solution for you. I use mine with an ATAS-100 mobile when I travel for business. You can have the best of both worlds. I program in frequencies, primarily on 17 and 10 meters as a place to start on HF. Then I use the up-down buttons on the mike to tune off these frequencies if they are in use or if I want to look for someone calling CQ. When you change bands, all you have to do is hit the "tune" button on the FT-100D and the ATAS-100 automatically gets an acceptable swr.

I also have 2 meter and 440 band edges set so that I can scan for repeaters (or even simplex qsos). My suggestion is not to try to work HF and VHF/UHF from the ATAS-100. I use a separate 2 meter/440 antenna and it works great!

Regards,

I use my FT100 often on the HF bands and find tuning no problem while driving. It all depends on where the front panel is mounted. I would suggest you purchase the (rather over priced) separatiuon kit and mount the front panel so you can rest your hand on something while tuning. The tuning knob requires a very light touch and is almost impossible to tune accurately on SSB while mobile unless you can rest your hand. Mine is mounted on the centre console of my Isuzu Bighorn (Trooper in the USA) immediately in front of the handbrake lever. You can rest your hand on the lever while using a finger to tune around. I travel up to 4 hours each way on faults at times so have plenty of time to chase the DX etc. Also ensure you can easily read the display with very little eye movement or at least at a very quick glance. The exact frequency doesn't matter as long as you don't stray out of band. Use the memories for the commomn frequencies or VHF as well. You soon get used to finding the various controls by touch without having to look at the radio. The only difficulty I have is switching the noise blanker on and off. It is hard to find the right function by touch. As my Isuzu is Diesel powered, I only need the noise blanker when travelling by noisy power lines, electric fences or near other petrol powered vehicles.
Get an auto tuner (or perhaps the ATAS100) and you will have a lot of fun without being confined to the one HF band. I use an SGC239 with great success. This allows me to use my 20 meter whip on any band from 80 through to 10. The ATAS won't tune 80. If I know I am going to be on a particular band, I use an antenna designed for that band, but the SG239 gives the flexability to change bands without stopping the vehicle. It is also very fast to tune.

Grant, ZL2BK.

Topic: 11447  Message: 11452

Congrats to Kevin on his upcoming ticket. I recently bought a FT-100D and I love the rig. I haven't used it mobile (yet!!), but have used it in a base station and portable with a couple of deep-cycle batteries. I use an Outbacker for portable ops (I use radials and a Vise grip tyoe clamp for the antenna) and a G5RV through a MFJ matcher for base use. I like the Outbacker antennas because they give you 80-2 meters (I only use it on 80 thru 6), they are rugged, and they look decent. If you use a remote automatic tuner (LDG makes a reasonably priced 80-6 meter tuner), you can use a 102" whip and get a wide range of coverage also. I am going to mount my rig in my 1996 Jeep Cherokee with the Outbacker and a LDG remote tuner and a remote head (I may eventually rig up an ALC circuit with a timer on the PTT to give a low-level signal for 15-30 seconds to allow one-touch tuning). I will use a separate antenna for 144/440.Hope this info helps.

# 11453. Re: [FT100] New Ham?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-05 19:47:13 UTC
From: Greg Williams
Topic: 11447  Message: 11453

I went to my first HAMfest in three years and on the way up we used my friends FT-100 with ATAS-100 antenna. Lot of stations, but oddly little if any DX that we could pick up. Mustve been a slow day...

He drove while I tuned up and tuned in. It does make the time pass (with all the knob turning). One odd thing that has nothing to do with the radio was that the only stations out there were the general ragchewers who only want to talk to each other ("Well I think thats good, over to you, Bob" *no pause* "And I like blahblahblah back to you Bill") and no one calling CQ. But thats how some days go I suppose.

It took an hour to drive to and from. It didnt feel like it took that long thanks to the rig. Maybe next time I'll be the center of a pileup...

It does seem to be too distracting if youre not used to the rig. So be careful that you dont have your head down looking at the display instead of driving. Lord knows I've almost been killed by the cellular yackers who dont pay attention to stop signs, oncoming traffic, and yellow lane dividers...

It's obviously lots more money, but I figure that why be unhappy with a low power HT and not hit the repeaters when you can have the whole shebang!

Comments anyone?

# 11454. Re: ATAS-100 stinger length??? (Can you add a longer one???)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-05 18:34:02 UTC
From: n9cv
Topic: 11414  Message: 11454

I drive mine into the garage daily with the ATAS 100 attached. I mounted the ATAS-100 lower on the vehicle so only the stinger hits the 7 foot garage door. When I get out of the car, I tie down the stinger to my roof rack with a plastic tie wrap the has a hole in the end of it. Sometimes I just just hold the stinger out of the way when I close the door. I have had no problems with the compromize installation.

A few times I have forgotten to release the stinger from it's plastic hold down and still made contacts on the road with no damage to the radio or antenna.

You did not state what class of license you are testing for. DX means different things to different people and is highly dependant on license class. If your class will be technician, then mobile DX will probably mean I hit some repeater 75 miles away with the occasional band opening of 300 to 400 miles on FM.

If your new license will be General or above then DX takes a different meaning. DX on HF is usually foreign countries or islands. Working US states and Canadian provinces are an everyday thing and not usually considered DX on HF.

With that said, I use an FT-100 / ATAS-100 combination mobile with no problems. I do a lot of listening and about once a week work some foreign island or country or island on HF. You are at a disadvantage mobile in a pileup due to your lower power and a less efficient antenna than the big guns you are competing with. I have found that you can unually get through anyway with a little persistance. Just make sure to add the word mobile to your call sign and usually the distant station will come back to you if he just hears the word mobile. I have not tried to do mobile CW with the FT-100. I am not that good to do CW and drive at the same time.

I think the FT-100 mobile is a good overall solution for all mobile work. It is a very expensive solution if you are only going to use it for 50 MHZ and above. If you are only interested in 2 meters or 440MHZ go buy an Icom 207H for less than $300. BTW Kenwood and Yeasu also make similar radios to the 207H in the same price range.

If your initial license is General or above (or you plan to upgrade to General or above) buy the FT-100D.

I have an FT-100 in my truck and have worked over 220 countries
while mobile, most of them while driving. Just don't try logging
them until you pull over !!
My antenna is the Hustler with 4 "stingers" at the top for 20/17/15
and 12 meters. I set up each band edge (both CW & Phone) and the
RTTY sub-bands in sequential memories. Makes it easy to change bands
and no antenna tuning.
The ATAS is nice, but the Hustler works just as well for a lot less
money and no moving parts to "gum up".
Since I frequent a lot of repeaters, I also have a pair of Kenwood
commercial radios (VHF & UHF) that goes into a Duo-Band antenna on
the roof.
Good luck on the test and welcome to the wonderful world of Ham Radio.

When I first started keeping the FAQ a few years ago, it was small and had only a few images. Over time it grew along with my personal web site so that it over flowed the 2MB limit allowed by AOL. When I got a cable modem setup, I moved it to @home which allowed a whopping 10MB limit but I soon outgrew that and had to start splitting it up again which is a pain since you have to make absolute links to various parts of it and you can easily break a link if you're not paying attention. @Home wasn't the best hosting service, since that wasn't how they made money and they would frequently drop users who were downloading large images, such as the ones we have on the mods and ATAS pages. It was really frustrating to hear from about the problems some of you had with those images.

@home went bankrupt about a month ago and so I had to move it again, borrowing some space from a friend. I did get an AT&T connection cable connection along with some web space to replace @home, but I've learned my lesson that ISPs don't like to host websites because it's a headache and they make no money from it. So I went out and got a domain name. That's right, you won't have to go looking around again if my host goes belly up or becomes incompetent about hosting because I can move it without changing its URL. So here is the new and hopefully last location you'll have to bookmark for the FT100 FAQ:

http://www.k0lee.com/ft100faq.html

That should make things easier in the future...

Subject: [FT100] New (and final) FAQ location

When I first started keeping the FAQ a few years ago, it was small and had only a few images. Over time it grew along with my personal web site so that it over flowed the 2MB limit allowed by AOL. When I got a cable modem setup, I moved it to @home which allowed a whopping 10MB limit but I soon outgrew that and had to start splitting it up again which is a pain since you have to make absolute links to various parts of it and you can easily break a link if you're not paying attention. @Home wasn't the best hosting service, since that wasn't how they made money and they would frequently drop users who were downloading large images, such as the ones we have on the mods and ATAS pages. It was really frustrating to hear from about the problems some of you had with those images.

@home went bankrupt about a month ago and so I had to move it again, borrowing some space from a friend. I did get an AT&T connection cable connection along with some web space to replace @home, but I've learned my lesson that ISPs don't like to host websites because it's a headache and they make no money from it. So I went out and got a domain name. That's right, you won't have to go looking around again if my host goes belly up or becomes incompetent about hosting because I can move it without changing its URL. So here is the new and hopefully last location you'll have to bookmark for the FT100 FAQ:

http://www.k0lee.com/ft100faq.html

That should make things easier in the future...

# 11463. High SWR Icon and low power on 40M

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-05 23:17:39 UTC
From: barry_zoll
Topic: 11463  Message: 11463

Good Day!

I noticed from 7.225-7.230, that the SWRX icon shows up while transmitting even though my esternal swr meter shows 1.1:1 and the power meter on the radio reads 40 watts. The icon goes away up the rest of the band but the output doesn't reach 100watts until I get to 7.270. Using 40M Ham stick. Radio and 3 magnet mag mount are grounded to the frame of the truck. No problem on other bands. Unit serial # 1H series and was purchased in 10/01.

Any thoughts? 73 de N1toq

Hi Kevin,
Congrats on getting ready to take your first license exam.
It's a wonderful hobby to be involved in. Been hamming 29 years now since a teen.
Whatever you decide, my advice to you and any newcomer is to not mess with handy talkies at first.
They're really not what they're cracked up to be.
Particularly if you're in a rural area away from repeaters, as well as other reasons such as batteries, etc.

The FT-100d is an excellent choice. The Cadillac of HF mobile rigs indeed.
The DSP is one feature alone that makes it the only logical choice for HF mobile use...
Top that with 2 meter, 440 mhz and 6 meters, what more can you ask for???

73' and good luck in your quest for that coveted ham license.

You are overlooking the possibility of working SSB/CW on 6, 2, and 440 as a Technician. Lots of DX has been possible lately on 6, and of course you can often work a couple hundred miles on 2 meters, even with the usual cross-polarization, when the home station has a good antenna. And limited satellite work is possible, too.

Although I am an Extra class ham, I enjoy mobile 6m and 2m SSB and even CW from time to time!
So, yes, you'll be in "Ham Heaven" with the FT-100 and the one hour rural drive with a high class license, but there's a lot of possibility for Techs, too.

# 11466. BAD FT-100(?)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-06 03:14:52 UTC
From: kb3bmt
Topic: 11466  Message: 11466

My new-to-me FT-100 seems to be suffering from several common problems. 1) High SWR icon. Intermittently on 20 Meters. Using a Hamstick and 100 watts. The meter says less than 1.2 to 1 in the area I work (around 14.330) antenna is OK. Tried a friend's rig with no problem 2) Sometimes no TX output. Can't figure this one. Also intermittent. Maybe tied to the SWR Icon. Icon not on when suffers power loss. ALC meter also shows nothing when there is no Xmit power. (nothing from the mic?) 3) Low audio output. External speaker helped some. Maybe an amplified speaker? 4) Reports from other stations of RF on my SSB signal. Went through all the menus and reset everything to default values. Reduced mic gain to 35-40. SWR is fine. Feed line is great. Nothing seems to work.

Do I have a lemon or what? Candidate for the Yaesu hospital or worse?

Any help or suggestions would be appreciated.

Jim, KB3BMT

Hi Jim

If the swr mod hasn't been done, you NEED to do it. Also the fan mod. This might take care of your problem.

The other thing is how well do you have it grounded? If you don't have the radio VERY well grounded then you are asking for problems. Make sure you have all parts of your car grounded. The other thing is to make sure you have both power leads going direct to the battery. When you operate, make sure you have the engine running. The radio wants 13.8 volts. What you are being told is rf on your signal could be low voltage.

I hope this helps out.

I wish you the best of luck on passing your ham exams. I passed my novice test 48 years ago next month!
My first mobile installation was in 1955 using PE 103 dynamotor and command (WWII surplus) sets for rx and tx.
The FT-100 is an ideal transceiver for mobile and easy to operate while driving (very carefully of course) on HF as well as VHF/UHF. I first bought my FT-100 for mobile use in the car and liked it so much I bought another one for my base station and set them up identical.
I also have a Yaesu VX-5 HT which is a great HT with lots of features in a very small package.
To answer your question, and it appears you have answered it yourself, go with the FT-100D a truly great rig and then get the HT later. You will probably get a lot of use for them both as you get into amateur radio.

Greg,
I use WinLog32 here. Tracks all of the awards including VUCC, easy to use, will work automatic with several call books on CD rom, AND the frreware version is fully functional although if registerd (10.00 US I think) you get a really nice set of maps the track beam heading ect...You can download it from www.winlog.co.uk. I have seyyled down with this one for HF contesting, casual logging, and most of my U/VHF logging to track grid squares. I use another program for VHF contesting logging. Give me shout in email I will be happy to answer any questions you like

Andy,
To get to the 4 mtr band (75 MHz) you might have to change the
DESTINA V/U F MENU 58 to EU. When you do this it will wipe the
memories. In order to change the destination change F58 to EU and I
think then you will have to to a reset as well. The RX on the FT 100
is pretty good in 75 Mhz. I would not open it up unlees you plan to
be in Europe as this will change the band edge limits to ITU zone 1
rather then ITU zone 2. I am assuming that you are a US ham mind
you since you did not include your call in your posting.

Hi, Andy.

So fare I know there is no way to transmit on 4m with the FT100. Even not when switched to UK.
I checked all positions from EU1-EU4 AU and JA.
The ft100 does not transmit on 4m.

The only rig who transmit on 4 m it the ft 847.

Congratulations, Kevin, or getting your ticket. Ham Radio is greatl

I suggest you NOT program the band edges in sequential memories. I skip four of five memories between the band edges. The FT-100D has an option to skip blank memories when scrolling through the memories. When I programmed my radio, I left several blank memories between each of the bands. That way, when I need to add a favorite frequency for a net, I can add that to my memories in the proper location. Makes working with memories a breeze.

Don't feel like you have to use a autotuner. My $50 (used) MFJ manual tuner allows me to use 20 thru 6 with the 102 inch whip, and all I have to do is remember the settings on the knobs. I don't use a separation kit, either; my whole rig sits on top of my car stereo in my console.

Well, his return email address is in the UK, so I would think that he would want the EU version. If he bought the radio over there it should be the EU version. Check the 'hidden' menu at the F58 location to see which version you have. See FAQ

http://www.k0lee.com/ft100faq.html

for details.

# 11479. updated catsPaw FT100 control program beta 0.91

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-06 23:46:55 UTC
From: jordan0129
Topic: 11479  Message: 11479

Sorry for the long absence. been busy with the holidays.

just uploaded the latest CatsPaw beta 0.91 program.

new features include :

1. SWR Plot
2. Activity Scan
3. frequency scroll bar

the SWR plot and Activity scan has not been fully debugged yet, and
may have bugs. also not all the features have been implemented yet as
you can see with the graph with is rather 'elementary'.

i welcome all comments and suggestions on how to improve these
features and the program overall.

i won't have my computer for a couple of weeks starting jan 15, so
bear with me. i won't be able to post any new fixes or answer any
emails, but should be able to get a newer computer by feb 1.

file name is catspaw091.zip in the files section.
this beta will expire on 02/28/2002. by then i'll have another
version with fixed bugs and more features.

Hi, I think the point they were trying to make about memory on the FT100 got missed. There are several types with differant uses. If you use the "PGM" memory you can use it to limit the tuning range of the FT. By putting in the band edges for your license and mode you can tune or scan a band while moble with out having to look at the dial. It works great and you stay in-band. All it takes is a turn and push on the select knob. For favorite channel freq's use the "MG" mem.

Hi,
Well you are right , but even switching to EU version the FT100 will not transmit on 4m.

See you Luc -LX1IQ-

Subject: Re: [FT100] Re: 4m mod?

Well, his return email address is in the UK, so I would think that he would
want the EU version. If he bought the radio over there it should be the EU
version. Check the 'hidden' menu at the F58 location to see which version
you have. See FAQ

http://www.k0lee.com/ft100faq.html

for details.

From: backhoefade
Topic: 11463  Message: 11483

It sounds like the often seen spurious oscillation problem.
Most often it happens on 24 MHz and 28 MHz. The oscillation is at about 13.65 MHz and 2x and 3x that frequency. I have seen it with a spectrum analyzer. The reason you see the high SWR icon is because there really is a poor SWR at those frequencies since your antenna is resonant only around the desired transmit frequency. Funny thing I found was that the oscillation would stop when I lifted up the back portion of the chassis top cover slightly. But the final remedy was implemented in Cerritos by the Yaesu service center. They add some internal ground straps that cure it. If you want to do it yourself there are photos of the modification at this website. If you decide to send it in you should also ask for the "VHF/UHF fan mod" at the same time. I believe Yaesu may be doing those repairs for no charge even if it's beyond the 1 year warranty but they will charge you $75 for a re-alignment fee plus you have to pay postage each way. You have to check with them for their current policy. Be ready to part with the rig for quite a few weeks unfortunately. When you get it back you will have a perfectly running rig though. Don't spend a lot of time playing around with external grounding, ferrite chokes, etc. as you will find that the only sure cure is the internal grounding straps. Many of us have gone through that frustrating lesson.
Good luck es 73's N6AF Charles

You should probably confirm the spurious oscillation is present. Do
you have access to a spectrum analyzer?
Also, you can try the rig into a good dummy load. If you still have
that erratic behavior you can be about 99% sure it's the spurious
oscillation problem.

I have no doubt that all of you are sitting on the edge of chairs waiting to hear about the outcome of my SWR problem. It has been a couple of weeks so to bring you up to date, you will recall that I installed a brand new FT-100D, s/n 0D..... (built almost 2 years ago) in my F150 pickup and I became frustrated over not being able to get rid of the SWR problem that I was experiencing on 10 and 12 meters while using an ASTA-100 antenna. After reading this group and getting recommendations from several of you, I called the place where I purchased the radio and had several long talks with them. They were understanding and gave me no trouble. I have sent the rig back and it should arrive there today or tomorrow and they will be sending me a new one with a later serial number. I have requested that they verify that the SWR mod is already installed because, if it isn't, I will be returning the radio for a refund. Since purchasing it, I have found another store that will guarantee me that they will send me a rig that is already modified.

# 11486. AM Filter Installation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-07 18:44:28 UTC
From: dabon8r
Topic: 11486  Message: 11486

I just completed the grueling AM filter installation with a huge sigh of relief that my radio still turned on after I got the screws back in. I fired it up, but after re-setting the filter submenu to reflect the existance of the new 6kHz filter, I appear to have done something wrong.

I installed the filter per the directions in the Yaesu manual. I got all the cables back into place, but when I set the submenu to 6.0, the receiver becomes deaf on AM. It attenuates the signals 100+dB!

Have I missed something? Is there some undocumented procedure I need to follow to restore the filter's operation?

Has anyone else had this problem? It's pretty critical!

Thanks in advance!

David Black, KC0JB

Ah, sorry about that Sandor. G8ERT is the call. I'm in the UK, I should
have said.
We have a half Meg allocation at 70MHz - a goodly chunk of which is
designated for digital modes which I've been getting interested in
lately, hence the interest in modding the FT-100.

Another posting in here suggests that there isn't a suitable setting
anyway, so I may have to mod some low-band business radio gear to do the
job.

Thanks for the reply.

Cheers.

Andy.

Many thanks for the reply Luc. I hope Yaesu will include 4m on their future "all-band" rigs It would encourage more people onto the band. As the saying goes "use it or lose it".

To All,

This is my first post to this group, and I had been playing around with this rig for about two months now.

I am very happy with it and it does everything the books said, except with one minor problem.

Until now, I cannot go to the second menu, ( hidden) No matter how I pressed the ABC button on power up, the menu never appeared.... Need help on this, or did I miss something on the procedures.

Thanks.

Thanks for the update. My entire family including many distant relatives have been waiting to hear from you!

All kidding aside, I want to warn you that you have to be careful about what the store means when they say it's "modified". All of the units sold over the last 2 years or so come with a marginal modification for the spurious oscillation problem which is only temporary in nature if it in fact works at all. The marginal mod is an attempt to add some grounding to the inside of the rig but they do it with sticky-backed copper tape. After a few months of operation the adhesive tends to dry out, the strap loses some of its conductivity and back comes the oscillation problem. The proper modification involves installing metal grounding straps that actually get screwed into the chassis rib that runs across the middle of the unit. So that's what you need to verify is present. The other mod you want to have in there is the one that fixes the UHF/VHF fan problem. They add a thermostatically controlled switch to the PA section that will allow the fans to come on during receive operation once the temperature gets high enough. Without that mod the fans won't turn on during VHF/UHF receive except for a few seconds after transmitting. The very latest rigs might have that mod in them. I don't know. Good luck. Once you have those mods done all your frustration will be in the past and you'll be able to focus on the right thing - having fun with an excellent radio.

Date: 2002-01-07 23:31:52 UTC
From: backhoefade
Topic: 11486  Message: 11492

Sounds to me like one of the following:

1) Confirm that you installed it in the 6 kHz slot, not the CW filter slot.
2) There is the remote possiblity that the filter is actually bad but that seems unlikely.
3) Also very unlikely, it's possible that somehow the pins didn't make contact.

I put mine in and ran into some really strange receive behavior that had me almost sick with frustration until I figured out that I had slightly pulled one of the ribbon cables out of its socket. I re-seated it and the problem dis-appeared. I don't think that's your issue since it apparently works in SSB mode.

Take some solice in the fact that you can expect fairly decent transmit audio reports once the filter's in. And you'll have a well defined receiver passband too, not the 12 kHz wide or so passband that you have in AM operation without the 6 kHz filter installed. The rig uses the broad (12 kHz 6 dB down?) LC type filter that's intended for FM receive if you don't have the 6 kHz filter in there. Read my postings about AM operation. Type F51 in the search box to find the postings. I think they're titled "AM Operation with the FT-100D".

You are in for a pleasant surprise. While simultaneously holding in all three buttons (A,B and C), power up the radio. Next, when you press and hold the FUNC button to get to the menu it will just show the regular menu. But now keep scrolling past the last standard menu item (i.e. number 66 or whatever the highest number) and you will see F1 through F66 or so. That's the "hidden" menu.

Chas,
Won't the "optimum" settings vary with everyone?
That's the main reason I forced myself to learn how to
use a scope. That way I can watch the audio and modify
the settings to get maximum output before the
distortion takes place no matter what mode I'm in.
Just my $.02 worth.

# 11498. Main knob

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-08 02:55:55 UTC
From: ke5wj
Topic: 11498  Message: 11498

Has anyone had a problem with the main tuning knob? The knob on my FT-100D is loose and appears to be getting looser, although it still works fine. I pulled the front panel off and looked inside and the entire optical unit is loose. I'd like to fix this before it falls off. Any ideas?

Also, I've noticed that the right side of the rig gets pretty hot to the touch after operating a while on HF. The rig's fine and works flawlessly so far. Is that amount of heat normal?

I'd prefer to check these things out before they give me any problems since I'm operating from YV-land and sending the thing in for repair would not be a pleasant option.

Thanks in advance for any help.

Does it not move at all, or are you getting a high SWR on 6M?

Occasionally the FT100 forgets where it last parked the antenna. You can force it to move by keying the radio and quickly pressing the up or down buttons to move it in the direction that you wish (I assume that if you're coming from 10M, you're going to want it to go down). Continue to hold the button down and you should see the 'Tune' icon appear, and the antenna start to move.

Once the antenna is tuned properly, it will probably be OK the next time you tell it to tune to 6M.

Bob

Luiz, Visit my web site: http://b.hillard.home.att.net/ and go to my ham radio station section and you'll see my Backpack FT100. I use a small sealed lead acid battery for power, and have a MFJ tuner built in to the backpack. I use a 'wall wart' transformer with a regulator for charging the battery after use. Be sure to reduce the display brightness on the radio to reduce the power consumption on receive. The radio draws 1 amp on receive with the display brightness at max. Reducing the brightness brings the receive power consumption down by a few hundred milliamps (I don't remember the actual reduction, but it's significant). The new Joey antenna by 'Outbacker' would probably work FB with this setup. I've used the Outbacker Perth on a ground coupled antenna mount with this setup, as well as a random lengh wire antenna. Good Luck, Bob --- In FT100@y..., luiz lissoni wrote: > Do you believe that with a pack of batteries I could > operate the 100D like the 817 ? From: backhoefade
Topic: 11486  Message: 11501

No chance because just the receive draws more than an amp and when transmitting even at low power it draws several amps. I have a DC power extension cable that allows me to connect to my power connector in my car and operate next to the parked vehicle such as on a picnic table. That's about as portable as you're going to get with the 100D. You might consider buying an 817 or a K2 for true portable op. --- In FT100@y..., luiz lissoni wrote: > Do you believe that with a pack of batteries I could > operate the 100D like the 817 ? # 11502. Re: Measuring TX audio response

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-08 07:41:34 UTC
From: backhoefade
Topic: 11439  Message: 11502

Yes - a scope is a great way to check for compression. But I'm talking about frequency response which is difficult to view with a scope. Come to think of it you could use a scope to look at the envelope magnitude as the test signal is swept. You could find the 3 dB down corners and see the ripple in the passband. You're right about the unique "best" response for each operator's voice. "Best" audio is in the ear of the beholder.

You need the "VHF/UHF fan mod" to allow the fans to function during
extended periods of receive.

Topic: 11439  Message: 11504

Thankyou, these changes from defaults as described
below have fixed up the tx audio on my ft-100d
with the stock mic.
One further comment...Speak in a normal 70 db voice
level across the mic. Do not overdrive the mic...
I listened to my rig on another receiver following
these adjustments and speaking quitely into the mic
an wow! "Sounds just like those old FT-102's with the
3 6146's and the broadcast quality audio!"
Thankyou for your time N4XEO

Hi Federico,

It seems that the FT100 group is no longer hosted at Yahoo Groups or is
having some difficulties showing up. Do you have any problems with it?

Federico,
I was wondering if you got any of the 3 emails I sent to you this weekend with regard to all of the Run Time errors and other little problems I was getting in your CAT software? I was just curious.
Thanks
Sandor

# 11509. CATsPAW v0.91

Yahoo group: FT100 (2002-01 — 2002-06)

From: kg4fet
Topic: 11509  Message: 11509

Jordon,
I want to thank you for the quick responces to my qustions about
your software.

The Group,
I have tried the 3 CAT programs that have been floating around the
group here of late over the last 5 days or so. Jordon's CATsPAW and
Bob Hillard's CAT 100 have been pretty good but CATSsPAW has been the
most error free so far for me. Jordon has been the quickest to reply
to my questions although Bob has been right up there with my
questions about CAT 100. To these two I want to say thank you for
the hard work and quick responces and to the group I would like to
say give them a try if you need CAT software for your FT 100.
Thanks again Jordon and Bob for the great work and 73 to all

Topic: 11510  Message: 11510

what are all the MODs?

i think i have the hi swr problem! but, i have surfed this site's files and messages for a fix and haven't found a clear description of who should fix it or how i should dive into the bowels of my precious FT100D. will someone, please, list (or point me to) all the mods that repair these design/fabucation flaws that only thorough use can find. please, indicate if the repair requires factory level expertice.

thanks
af4jj

Hi Kevin,

Hope to hear you on the air also. Please do some reading here
before purchasing so you know what is expected of you when installing
the FT100 in the Mobile. I have been mobile with mine since Aug 99.
If you buy one now, make sure it is modded if you buy used or if
new then make sure its a May 2001 or newer so at least one of the
mods will be done.
I have one of the originals, it works fantastic and always has.
Minor complaints here and there but I chalk it up to being luckier
than others in most cases.. The key to a successful installation in
the mobile with an FT100 is grounding, a good antenna(s). More
Grounding and a good solid connection direct to the battery.
Check out some of the old messages here, go back about three months
and read up to now and you will fit right in here. Dont be afraid by
what you read as it is a good radio, just be an informed consumer and
make sure you get a modded one or the newest run you can find..
Regards.. Richy N2ZD

# 11513. No RX or TX 14 Mhz - 4.7 Mhz

There is a very detailed text file in the files area I have posted.
I have also uploaded quite a few pictures for the filter installation
and these would be helpful in doing the mod also.. Check the files
area.. Regards.. Richy N2ZD

# 11516. Re: [FT100] Re: Measuring TX audio response

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-09 02:16:52 UTC
From: John Spiceman
Topic: 11439  Message: 11516

Chas,
You're correct. Freq response IS difficult to measure with the scope.
As far as the magnitude, just measure the height of the xmas tree peaks and keep increasing the audio/mic gain till it starts to flatten out on those peaks. Then back off a little. This should be the point of maximum output and will be different for everyone.(in theory)
Wonder what the processor would do to the sinewave you will be injecting on your test. Will be interesting to see. Maybe thicken it ???? Maybe there is a point in advancing the processor where you might see distortion showing up on the thicker wave ???
I've got a pretty good scope and audio generator so i might do the same experiment and just see what happens.
I've also been told that in AM mode, you can see downward modulation when the AM carrier is set up too far. I'm going to verify that too.

Regards

From: backhoefade
Topic: 11439  Message: 11518

I previously looked at the envelope with a scope. You can see that
the correct unmodulated carrier power for AM operation is 25 watts.
On the expected voice peaks of 100 W PEP the waveform is clean, as it
should be. If you want a little more overhead you can set F15 to
around 170 so the rig can enjoy about 150 W PEP but I'd still set F51
for about 25 Watts unmodulated. Then you definitely see solid
"upward modulation" on an external power meter while yakking away on
AM. I also gauged roughly the percentage compression that the rig
has. It's fixed at only about 12 dB or so. Enter F51 in this site's
search window to dig up my old AM postings. Run the mic gain at 17
and if you run the processor set it to 17 when running AM.

I would not say "only" in regard to 12 dB of comprerssion. On any rig I've had with compression metering, I have only run about 6 dB to keep good audio.
I guess this means that if you use the processor and close talk the mic, you're using 12 dB compression, like it or not. No wonder I can't usually get my processor to sound very good.

Dears Friends.

I have problems with my FT100, when I powerup the radio he has a good reception however after my first transmission the reception falls about 40db more or less.
What can be happening? They exist some form of repairs without having to send for United States, because I am in Amazon in the north of Brazil and it would be quite complicated to send for any place.
Thanks and sorry about my english.

# 11522. Re: ATAS Owners, Fair Warning (i.e. expensive failure mode)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-09 14:53:39 UTC
From: w1pa
Topic: 11203  Message: 11522

Ref: Message 11203

Last night I was bored and I dremmeled open the base teflon tube (bottom 3") of my inopperative ATAS with the open in the base (open circuit from plug ground to control board ground); I have a replacement base on order --- Cerritos is _still_ having computer issues.

I was correct. The solder connection form the bottom/base/PL239 ground side to the internal coil had opened -- nice visible air gap. The pin holding the plastic tube offers just enough play from the concentric PL239 to the outer metal case to move slightly, and over time it stressed and failed.

http://groups.yahoo.com/group/FT100/files/ATAS100.doc
(the solder connection directly below "ATAS" in the top image)

Be gentle if you take your ATAS on and off a lot.

btw -- my old broken ATAS has metal pins holding the metal ends of the bottom three inches into each end of the tube. New ATAS's have a pin on one end, and _screws_ on the other. I'll hand Yaesu one thing... they at least seem to feedback from the fails back into their production, allbeit not soon enough for us. :-)

I purchased an MFJ-933 from a HAMfest vendor but they forgot to tell me that I need an 8-pin to 6-pin modular jack adapter since the back of the desk mic is an 8-pin and the FT-100 is a 6-pin!!!

So now I have to plunk down 25 more buck for an adapter...for now...once I get the pinouts on each of them Ill fashion my own and either resell it or send it back for a refund...

Once I get it set up I'll let you know how it tests out.

I had another failure. The Comet CQ-5M quick-release mount popular with the ATAS... the center receptacle for the pin twisted and broke off inside the mount. There seems to be very little preventing the socket and the white insulator from rotating inside the SO-239. Second failure... the first was the RG-174 pulled out. I removed the shiny cover with three screws and resoldered the RG-174, and used heat-shrink to make the coax fatter to grip inside better.

As I've posted before ....

The tuning assembly is held in place by an elcheapo
coiled spring (instead of a sensible and dependable
nut) around the bushing.

Slip something smooth under the rubber tire around
the knob, loosen the knob's set screw and pull the
knob off the shaft. Reset the spring ... or if you can
find the proper metric size ... replace it.

Thanks for the advice. I removed the knob and sure enough the spring was working loose. I twisted it back on and that seemed to cure the problem for the time being. I figured it was something fairly simple.

Thanks and 73,

Walt KE5WJ

I wonder what Yeasu does with the new radios that are returned to the dealers for refund? I know it is illegal for them to sell them a second time and and claim they are new. They can be sold as used or refurbished units. Anyone ever seen a Yeasu sale on these units?

Your rhetorical question is well stated.

On a positive note I ask "where the heck are all the used FT-100 and 100D's ?" I mean the ones for sale by private owners. It's interesting to see very few out there. So with all the complaining and criticism we read on this board I suspect that once the "SWR" and fan mods are done people are generally quite pleased with the performance of the rig. I know I am. I would think you would see a large number of these for sale on the used market if people didn't like the performance. But I just don't see them out there.

I was looking at the comments about the 706 on, I believe, the "e-ham" website. I read several complaints about the distorted receive audio when you use the noise blanker, distorted receive audio when you turn up the volume slightly, poor stop-band rejection when using the narrow CW filter (sometimes called "blow-by") and poor front end rejection against strong overseas BC stations. I don't want any of that in a receiver! With the FT-100D I don't have to deal with that.

Count me in, Hey Chip wanna sell off some of the returns? I would be more than happy to take some of them off of your hands.. My address is good in the book so start UPSing the returns there. I will even do the mods and cut down turnaround time for your repairs. For every twenty I complete, gimmee one returned defective FT100.

Anyway, I havent heard any of you on 18150, Lets go people!! While my ATAS is behaving on 17m this week..

# 11534. (no subject)

Greetings,

I would like to know the pinout on the Band data cable that controls the FC-20. I looked at the FC-20 diagrams in the Photos section, and could not read the picture when I made it larger. Also if someone has some resources such as websites dealing with the connections of the FC-20, I would be interested.

Does the FT100 control the FC20 by voltages put out by the Band data cable; what are those voltages, do they change polarity; and what does the SO-239 put out, is it just RF or RF and DC, as in the case of the ATAS-100???

Thank you,

Daniel

I agree with your statements 100%. I was very very displeased with Yeasu's customer service and policies earlier this year. Now that the mods are done on mine, I really like this rig. I posted this question wondering if there is a source for discounted refurbished radios. There sure isn't much of a used market that I have seen. The few I hav seen are getting almost new prices for them. If there is a discounted refurb source I would buy a second FT-100 to just to have it. I am not sure what I need it for yet, but a good deal is a good deal.

# 11536. 8-pin to 6-pin modular adapter info

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-11 11:04:18 UTC
From: Greg Williams
Topic: 11536  Message: 11536

Okay, I must start out that my patience with the "supplies" for the FT-100D are running thin...

I bought an MFJ-299 Desktop microphone last weekend at a hamfest and when I brought it home to plug in, I was reasonably miffed to discover that the plug going into the MFJ-299 is an 8-pin modular jack. Meanwhile the FT-100D has a 6-pin modular jack.

Okay, so I talked to AES and ordered what I thought was an 8-pin to 6-pin Heil adapter (after perusing the FAQ page) and when I got the package today, I find that it's an 8-pin modular jack on one end, and the other is for a PTT footswitch and RCA-type headphone plug! Oh boy!

So now, on top of having blown $32 for that, and almost $90 for the mic, Im still stuck without the ability to use the FT-100 with the desk mic.

Does anyone make an 8-pin to 6-pin modular adaptor? The 299 says it can support the FT-100 but I have yet to see it!

Topic: 11536  Message: 11537

Surely the quickest thing would be to chop off the 8 pin connector from the mic and put on a 6 pin one to suit the radio.

Second fastest would be to make up an adaptor (10 to 15 minutes). That way you can keep the new mike's cable intact.

The FT-100 book has all the pin outs for the radio in the front of it (page 4) which was something I was very impressed with, no searching through the entire manual to find them. I'm sure the Mic comes with a list of its pin outs. All you have to do is make up a short patch cable and you/re away. Even if you had to trace out the Mic pin outs with a meter it would only add a maximum of another 10 minutes.

Only thing I would have liked to see in the book would have been the circuitry of the hand mike that comes with the radio. It's not in the book or on the schematic. I had to open up the mike and trace it out and it is quite interesting how they get all those buttons on the mic with so few wires (4 including Gnd and +9V).

I already had a boom microphone in my car which came to a 6 pin DIN plug (which I have on many of my radios here) so I just made up a 10 minute adapter for it and away it went.

Anyway, good luck with it, Greg.

# 11538. Guarantee

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-11 13:58:31 UTC
From: Paulus
Topic: 11485  Message: 11538

Dear Group FT-100 members

I have a FT-100 KH266 89063 Serial No 9J025033, purchased in Japan

Could any of me members tell when this set was approximately made.

How long does Yaseu guarantee their Ft-100□s and are there any strings or impediments attached to their guarantees.

Paulus

HI, this is federico, xe2nlm

i think the convention used by yaesu is to set the apropiate frequency on the radio and then take out by the conector to the antenna tuner or to the amplifier

by 4 bits digital outputs, i wonder it is 0 - 5 volts by 4 cables and ground.
regards and 73

No, this is not good information. The FT-100 has an unusual keying/biasing scheme. A straight PTT and mic connection will not work. You NEED an adapter. It has more then a plug, wires and a socket in it.

And no, I do not know the details, but I think there is a schematic in the Yahoo!groups FT100 site's files section.

# 11542. Power Connector Supplier?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-11 15:57:46 UTC
From: k5btk
Topic: 11542  Message: 11542

Have any of you found a supplier for the plug to fit the power connector on the FT-100? The markings on the plug and socket are too small for me to make out the manufacturer's logo. One logo looks like a stylized "ICS" and the other marking looks sort of like "AC7". All I can really make out is the part mfg's part numbers of LO2F on the supply side and LO2M and LO2MB on the rig side.
Some time back I found what I thought was the correct part to mate with the power connector on the rear of the FT-847. It was EXACTLY the right style and shape - but missed in size by a tiny fraction of an inch. NO JOY!
It would really be nice for fixed station use to be able to make up a power cable only a foot long instead of using the cable supplied for mobile operation. I hate to shell out the $$ for an additional mobile cable and cut off all but the last foot.
The only Yaesu rig I had no trouble making up additional power cables for was the FT-817!!!!
...Don (K5BTK)

# 11545. Re: [FT100] 8-pin to 6-pin modular adapter info

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-11 18:06:38 UTC
From: The Simpsons
Topic: 11536  Message: 11545

The extras required are simple. Just put a 27k resistor in series with the PTT line (ie. RJ11 SW1 to pin 6 on the Yaesu 8 pin connector). The actual value should be 25.5k made from a 47k and 56k in parallel, but 27k is close enough. Add a 39k from pin 6 to pin 3 and an 82k from pin 3 to pin 1 of the 8pin Yaesu round connector and you will have the UP and DOWN functions working as well.

RJ11 YAESU 8 PIN KENWOOD 8 PIN
SW1--27k------------6 2 PTT
!
39k
!
----------3 3 Down
!
82k
!
-----1 4 Up

Mic In 8 1 Mic
Ground 7 7 Ground
5 8 Ground
9Volt 2 5 9Volt
NC
SW2

Really? I've never heard of that. I used to work for a manufacturer at a service depot (who shall remain nameless but isn't in the amateur business). Warranty returns (from exchanges) were repaired at the module level (replace a board rather than repair it) and sold as new.

Just out of curiosity, is that something in the Uniform Commercial Code, or something?

Just wondering...

Subject: [FT100] 8-pin to 6-pin modular adapter info

Okay, I must start out that my patience with the "supplies" for the
FT-100D
are running thin...

I bought an MFJ-299 Desktop microphone last weekend at a hamfest and
when I
brought it home to plug in, I was reasonably miffed to discover that the
plug going into the MFJ-299 is an 8-pin modular jack.  Meanwhile the
FT-100D
has a 6-pin modular jack.

Okay, so I talked to AES and ordered what I thought was an 8-pin to
6-pin
Heil adapter (after perusing the FAQ page) and when I got the package
today,
I find that it's an 8-pin modular jack on one end, and the other is for
a
PTT footswitch and RCA-type headphone plug!  Oh boy!

So now, on top of having blown $32 for that, and almost $90 for the mic,
Im
still stuck without the ability to use the FT-100 with the desk mic.

Does anyone make an 8-pin to 6-pin modular adaptor?  The 299 says it can
support the FT-100 but I have yet to see it!

Around here they are available at the local hamfests. There are always several vendors at the hamfests selling all types of connectors (both power and RF). I have seen the FT-100 power connectors (both ends) with or without cables. I think I paid $6.00 for the connector only. I am going to a hamfest on Sunday. I will check the price when I am there. There also is a web site that sells these, but I cannot remember the URL. If I find it I will append it here, unless someone else posts it first.

Hi Don,

I went a slightly different way and replaced the existing connector with Anderson Powerpoles. I have standardised on the Powerpoles for all my equipment so it becomes a lot easier. I have also put powerpoles on the pigtails out of the original connectors so that, in an emergency, I can still use either another FT100 with my setup or can plug my FT100 into someone else's setup which still has the originals.

Maybe an email to Yaesu (Vertex) would get you the info. I would assume that they are of Japanese origin.

BTW, my L02M has three symbols on it, the first looks like a lightening bolt, then what looks like a sloping "J" followed by sloping II. That is the one which you thought looked like a stylised "ICS" The other is "XC7" not "AC7".

Also both M and F have + & - polarity symbols on them.

73....Eric VK2KUR.

# 11556. Earthing problems - I've found it!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-12 13:08:27 UTC
From: DX-Radio Moderator
Topic: 11365  Message: 11556

As being a member of this group and also a proud owner of a FT-100, I've seen the questions about the high SWR on UHF without any reason. Today I mounted a new filter into the FT-100 and opened the machine for the very first time. I've never in my life seen something so poorly done! Should this be the latest within hi-tech? The cupper-tape used for grounding to the aluminium is as sticky as a cleaned window.

To improve the grounding by 100%, replace the cupper-tape inside with new better one, one that has a good sticky back-side. Be sure to press it tight to the aluminium. This will do alot. I've seen the modification with screws, and that's needed when the cupper-tape has a poor sticky backside. To be sure to get a good ground inside, double the lenght of the cupper-tape.
Now I can access UHF without any problems, 100% out.

Thanks for the pictures of the Yaesu-HQ-modification, don't remember who posted them to the group, but they helped me out to solve the problem.

Don:
I don't have a direct answer to your question but this is how I solved the Yaesu power connector problem.
Go to your favorite Radio Shack store and get polarized interlocking connectors 274-151 male and 274-154 female at $.99 each. These are 20 amp. contacts and are available at any Radio Shack store. I have two FT-100's, one mobile and one fixed along with other high current 12V devices which all use these connectors. Inexpensive, easily obtainable and they work!

Anyone had any luck getting their FT-100 running in TX & RX at 9600?
I've had no problem with my FT-847 (the FT-100 and FT-847 seem to use
the same pinouts, so at least I know the cable's OK even though
levels are different).

The Packet rate (Menu 37) is also set to 9600.

All other difital modes seem OK.

Topic: 11536  Message: 11562

Sounds like you ordered the wrong part. I recently put an after market microphone on my FT-100 that uses the standard Yaesu 8-pin DIN connector. In this case the Heil HMM-Y mobile microphone pre-wired for Yaesu 8-pin DIN connectors.

The Heil part you want is called an AD-100; one of several radio to mic adapters they make for the Yaesu series. It has the 6-pin modular plug on one end that goes directly into the FT-100 and the 8-pin DIN on the other.

The Heil part works like a champ. Was chattering away on 17-meters this morning with it. Suggest you return the incorrect part and order the correct one.

For the final conversion to 8-pin modular, what you need is a DIN to modular cable like those that are supplied with mics like the Yaesu MD-100 and MH-31. The best way to get one of these is to call Yaesu in Cerritos, CA and order one from the parts department.

Btw, the FT-100 uses an MH-36 series microphone that is also found in radios like the FT-90R and other VHF/UHF series radios. They are interchangeable and I think originally designed around these radios and not for the FT-100. These mics inject command signals into the audio in line which works fine for VHF/UHF operations. There's a tone generator and audio amp circuit in those things.

The mic is not shielded against HF EMI very well and I have had my share of feedback trouble with the MH-36 in a mobile installation. The mic's circuitry is the pick-up point for the EMI. The effects can range from an FM buzz to unreadable overdriven audio. This is really annoying seeing as you have to be pretty tolerant about stray RF in a mobile to begin with.

The Heil HMM mic has no such circuits and does not exhibit the problem. In my radio, the HMM-Y seems to run well on HF with the MIC GAIN set at 50 running mobile. The ALC behaves on all bands using a heavily counterpoised ATAS-100. A setting of 30 produced copyable but weak audio reports at highway speed; your mileage will vary. I have yet not optimized it for VHF/UHF but have started with the GAIN at 50, the factory default.

Hope this helps a little.

I did order the AD-100. But this one was an 8-pin modular on one end, the PTT footswitch adapter and headphone jack on the other.

Thats the part number that supposedly was ordered.

I called back yesterday and ordered the CT-69. I hope this is it. I returned the other part today. I hate having to pay for shipping but it was only $1

Regarding Yaseu guarantees.

I would be very interested to hear from any member from this group to what sort guarantee was offered by Yaseu when they purchased their FT-100's.
I am especially need to know if it was a one, two or three year (factory or local guarantee) offered with the set.
Did the negotiated price paid for the Ft-100 have any effect on the length to the guarantee?
Also were there any conditions or contractual arrangements in the guarantee?
Have you had any problems with the guarantee?

The standard Yaesu warranty (at least in the U.S.) is 1 year. I have never been solicited at a ham store to purchase an 'extended warranty' like I am at many other retail stores for other electronics products. Typically, the ham store (and there are precious few physical ham stores in the U.S.) will offer an exchange if the rig fails out of the box, but cuts you loose to deal with the manufacturer after a week or so. All of this can be 'negotiated' with the individual store owners, of course, since they can act as the middleman in a warranty claim, but they don't get any extra money, just customer goodwill by doing so.

A rig sent back to Yaesu after a year will often require a $75 alignment fee before they'll attempt to fix it. In the case of the FT100, Yaesu has been known to fix the SWR problem after the warranty period free of charge, but you still might get hit with an alignment fee.

I believe the standard warranty for the FT-100 is one (1) year. I bought one of the first ones that came into this area and it developed an SWR problem on 440 MHz (only on 440). After trying to fix the radio, without success, YAESU replaced the radio. You cannot get better warranty service than that.
The fact that I own several YAESU radios had nothing to do with the quality of service. I just like YAESU radios and believe their service to be second to none.

Yes the Yaesu CT-69 and the Heil AD-100-8 are equivalent parts. They
both have 6-pin modular jacks (RJ-11) going to male-DIN connectors
(round metal) and are wired specifically for the FT-100 radio.

You can see a picture of a Yaesu CT-69 here:
http://www.powerwerx.com/ft100.html

You can see the Heil AD-100-8 here:
http://www.heilsound.com/AD-1.htm

***

That part you got that has a modular plug and conections for a Heil
Pro microphone is called an AD-1-Y-Modular. It should have had an RJ-
45 (8-pin modular) connector and yellow plastic on the connectors;
other colors indicate wiring for other manufacturers.

This was the totally wrong part to buy. The 8-pin RJ-45 connectors
are usually found on Yaesu's Vertex line of commercial radios. The
only amateur model I can think of at the moment that uses the RJ-45
mic connection is the FT-900.

Bottom line is whoever consulted with you at AES gave you incorrect
advice. You are on the right track now.

Hi guys,
overhere in Holland I got 2 yrs warranty on my FT-100; in fact it was the second one, after being switched when the first one would not listen to what I was telling him, so dutch representative Schaart took it in, and gave me a brand new one. But also this one went back first into Techservices for the mods on fans and HSWR.
Now SWR goes up to 1 : 2.4 before it is limiting power, and fans are turning slowly on V/UHF-RX..
But, still a 2 yr written guarantee-period.

# 11570. FT-100D & ATAS-100 problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-14 00:07:12 UTC
From: radiobob300
Topic: 11570  Message: 11570

I just bought a new FT100D and ATAS - 100 and installed them on my Motor home which has an all metal roof. I followed the instructions and everything worked fine for about 30 minutes. I could press tune and the the radio and antenna seemed to be in perfect sync as I went from one band to another. Then when I went to 20 mtrs I got a hi SWR message. Going to any band even ones that worked fine now give the same message. I have measured the antenna with an MFJ SWR analayzer and the match is 1:1 or 1:5:1 worst case from 7 Mhz to 30 Mhz so I know that the antenna and ground are OK. Going to manual tune I notice that I could see the SWR dip on the FD-100, but as soon as I let up on the up or down button the antenna stops and reverses direction for about 1/2 inch which cause it to ALWAYS overshoot the true SWR dip. Now every time I push the TUN button the FT100D reports hi SWR and it take forever to manually zero in on the dip because I have to go past the dip each time as the antenna always travels in the opposite direction after I let up on the UP or Down button. Has anyone else had this problem? I took the antenna off the vehicle and mounted it on another ground plane with a new RG-8 coax and it did exactly the same thing. Since the antenna appears to have a good match across the full band, I think that the problem is somehow in the radio but I am not sure. Other HF antennas work fine with the radio but not the ATAS.

Thanks for any help.. Bob Ni6R

Rainer Arndt called me last week from Sweden and he was reading me an excerpt from a Yaesu repair shop letter and they mentioned this too. Normally, in order to get your product to appear in a movie, you have to pay some firm a lot of money to do a 'product placement' for you. Often times, you'll notice that the products have much larger logos and other slight modifications that make them stand out. So, does anyone know whose FT100 it was? Any chance it belonged to a member of this list? An FT100/ATAS100 doesn't end up on a Land Rover in a movie by accident. Some clever marketing person had to put it there.

Topic: 11561  Message: 11573

Hi Graeme,

I purchased mine about a month ago here in Sydney. It is actually a fairly old serial number being 9K12xxxx so manufactured in September '99. It had the copper earthing strips only.

I added the extra earthing strips today and also added a resistor so that the fans always run at a low speed and then will switch to high speed when transmitting. I find, generally, that it is much quicker to do these sort of things yourself rather than being without the rig for weeks whilst waiting for them to do it. You also know what sort of job you are getting.

Good grief, here is another SWR problem. You probably have the dreaded SWR problem that many of us have experienced. Mine was returned last week for replacement. If it, indeed, is the SWR problem, it is easily fixed by Yaesu but the turn around time is currently eight weeks. For this reason I returned mine to the distributor for replacement. Mine had a serial number beginning with 0D which means that it was built on February 2000 even though I purchased it a few days prior to Christmas 2001. Good luck.

Subject: [FT100] FT-100D & ATAS-100 problem

I just bought a new FT100D and ATAS - 100 and installed them on my Motor home which has an all metal roof. I followed the instructions and everything worked fine for about 30 minutes. I could press tune and the the radio and antenna seemed to be in perfect sync as I went from one band to another. Then when I went to 20 mtrs I got a hi SWR message. Going to any band even ones that worked fine now give the same message. I have measured the antenna with an MFJ SWR analayzer and the match is 1:1 or 1:5:1 worst case from 7 Mhz to 30 Mhz so I know that the antenna and ground are OK. Going to manual tune I notice that I could see the SWR dip on the FD-100, but as soon as I let up on the up or down button the antenna stops and reverses direction for about 1/2 inch which cause it to ALWAYS overshoot the true SWR dip. Now every time I push the TUN button the FT100D reports hi SWR and it take forever to manually zero in on the dip because I have to go past the dip each time as the antenna always travels in the opposite direction after I let up on the UP or Down button. Has anyone else had this problem? I took the antenna off the vehicle and mounted it on another ground plane with a new RG-8 coax and it did exactly the same thing. Since the antenna appears to have a good match across the full band, I think that the problem is somehow in the radio but I am not sure. Other HF antennas work fine with the radio but not the ATAS.

Thanks for any help.. Bob Ni6R

It does sound like you have the SWR issue with your rig and it would be best to fix that before trying to figure out what, if anything, might be wrong with the antenna. Beware using the manual tune and auto tune functions together. It's explained in the FAQ, but basically the FT100 remembers where it got its last good autotune postion and it uses this information to determine which direction it needs to move next time you request another autotune. HOWEVER, if you use the manual tune buttons and then attempt to autotune, it will move in the direction that you moved it during the most recent manual tune. If this happens, it can take off in the wrong direction and it will go all the way against the stop, reverse direction, and then go in the correct direction to get a match. This takes a long time. You can abort the procedure if you notice it's happening.

You mentioned in your message that after you leave go of the manual tune button, it REVERSES direction and moves ANOTHER HALF INCH in the other direction!? That has never been reported before and may indicate a more serious problem with the ATAS100 or the radio. The manual tune buttons are only supposed to move the antenna while you are holding them down. If the antenna continues to move after you've let up on them,

then that would indicate something is really amiss in
the antenna or the portion of the radio that controls
the antenna.

All this is explained in detail in the FAQ and there
is more information on the ATAS100 than on virtually
any other subject.

There was a lot of Yaesu kit used, all from Yaesu UK, as "product placement".If you look closely at the scenes in the "tech Room" of Croft Manor, you might be able to see a whole corner of FT1000's, FT847's, FT100's, Yaesu power supplies and some Yaesu marine kit. It was all powered up with arbituary frequencies set. In fact, I spent a few minutes making sure no amateur frequencies were used! It was all taken care of by props dept.You will certainly need to use DVD as I don't think any of the kit was particularly featured in any shots and indeed may just be in the background and out of focus. It was a good movie to work on from a technical point of view, shame it wasn't better received by the critics!!!

# 11580. Re: [FT100] FT-100D & ATAS-100 problem

Could you please expain in a bit more detail exactly
what the SWR problem is and how it affects the
operation of the radio? How do you know you have the
problem?

When I tune manually, I can see the SWR dip but if I
stop the UP or Down motion the antenna physically will
move back in the opposite direction just enough to
throw off the SWR dip way off resonance. If I go past
the dip far enough, and let go of the up or down
button, I eventually can get the SWR to land on the
low SWR point but it takes a lot of juggling the
UP/Down button with the overshoot problem, to make it
land on 1:1 on most bands.

The SWR overshoot only accurs after I release either
the up or down button when using manual tune. In
auto-tune it never lands on the dip. It will usually
stop at a point below the dip. I then have to use the
up button to overshoot the dip so that when it goes in
the other direction it will land on resonance.

After auto tuning, I get a high SWR Icon with a "0"
in it not the "X" that is shown in the manual. I only
get the "X" after I try to key up while the radio is
off resonance.

Having never seen any other FT100's I do not know how
the ATAS anntenna is supposed to respond to the SWR
dip.

Since there is circuitry in both the radio and the
antenna, I cannot tell for sure which one has the
problem. I may have to return both units to the dealer
as I just bought them yesterday.

It worked fine for the first 30 minutes!!!!
Thanks,
Bob Ni6r

Hi there

My FT100 gave me a problem two days ago.
The standby current is a whooping 10A, and the casing
was very hot

It still can receive on any band, and the knobs and
button are still functioning as what they are for.

There are two power transistor ( white colored body from
Motorola) which runs really hot.

I dont have the service manual to refer to...but I just
want to know if there are any one of you gentlemen
out there had experienced the same problem.

Does the Antenna icon on the radio indicate that it is going in the other direction?

It sounds as if you have an internal short. The power consumption on recieve should only be around 1.2A.

> SOS......anything that I have to do beside sending
> the rig
> to Yaesu

It doesn't sound like a problem that has been reported here, but you must have something wrong internally that definitely needs some factory attention. I'd suggest shipping it off for repair. When you get it back, it would be good to let us know what part was shorted.

It has been covered here on many occasions, so we've put it in the FAQ. Basically, it means that the internal grounding isn't working. It also causes a type of internal self-oscillation which makes the SWR sense cirtuit think you have an SWR problem even when you have a good match. The most commonly affected frequencies are the upper HF band around 10M, but it's also been seen on 440 and a few other HF bands. FMI, see: http://k0lee.com/ft100faq.html#intermittent

And make sure to follow the links to see the pictures.

This is a new problem that has never, to my recollection, been reported before. The up/down manual buttons should only move the antenna when you have them pressed in. To tune the antenna manually, you depress the PTT on the mic and the up/down buttons on the FRONT of the radio. Make sure to confirm this by watching the antenna, not just the antenna motion icon on the front panel.

The circuitry inside the ATAS100 is pretty simple, so if the antenna continues to move after you've let go of the buttons, it sounds like its more likely the radio isn't working correctly. The motion of the ATAS is dependent on the DC voltage that is present on the coax. If you let go of the up/down buttons and the

antenna actually reverses direction, the only thing I can think of is that the circuit that is controlling it inside the rig is confused. This *might* be related to the SWR/grounding issue, but it could be something new all together. The failure mode for the ATAS is for it to stop moving all together.

Resistor plugs and/or cables can do the trick, but the coil can act like an old spark transmitter. First of all, pull the spark plugs and clean and gap them, and don't forget to clean the grime off the threads on the plugs and the cylinder head. If that works, consider new plugs and cables - the dielectric in spark plug cables can go south due to the heat. Next, I would take 10 feet of coax and solder a loop of hookup wire to the end and use the loop of wire as a sniffer to determine whether the coil is putting out a lot of RF. If so, a new coil wire AND a capacitor across the primary lead to ground may be needed, BUT BE SURE TO CHECK WITH GM BEFORE YOU DO THIS - it can disrupt/destroy a computerized ignition. I am assuming you have a gas engine and not a diesel - if it's a diesel, your guess is as good as mine. Also, you might make a Faraday cage out of copper sheeting, aluminum foil, or even a large coffee can and ground it and place it over the coil as a test - if the noise disappears, you've found your source. And don't forget your engine computer - they can put out a lot of hash too. Hope this helps!!!

I am going to check that out. I did not realize that
the Icon is telling antenna movement direction.

I talked to Andy today at Yaesu and he suggested
putting a "T" in the line to measure the control
voltage being sent to the antenna, so that I can test
to see if the antenna is being told to go back by the
radio. Andy also suggested trying BOTH reset commands
first.

Apparently the antenna gets 12 volts going up and 8
volts when going down. It is supposed to stop when you
lift off the UP/down button but in my case that is not
happening. The overshoot can clearly be seen.

Thanks,
Bob Ni6r

On previous vehicles I have used, a major improvement was made when ground straps were placed across all engine mounts. If there is a separate subframe supporting the suspension and body, strap across those mounts as well. Also, if the coil was not mounted on the engine itself, then moving it there also helps. Not easy in a crowded engine bay.
With my present vehicle, I have no noise at all. On 14MHz, the s meter on the ft100 stays at zero except for noise external to the vehicle, with the noise blanker off. I have a 3.1 litre turbo Diesel powered Isuzu Trooper 3 door with the antenna mounted on the back door spare wheel carrier. I was concerned about fuel pump and computer noise but there isn't any.
Before moving anything on a modern vehicle, it would pay to check with the manufacturer to check it won't upset any of the electronic control systems. Could be expensive.
Good luck,
Grant, ZL2BK.

I know this is not going to help much, but I fought the same problems for months on an Chevy S10 blazer. Ground straps on the hood, doors, etc. New plugs gapped to the minimum, new ignition wires, new cap, rotor. I did not replace the coil. I even grounded the exhaust pipe in three places. Nothing helped in the least. Then one day I got in the car and all of the ignition noise disappeared. I have been waiting for it to return, but it has not. Maybe you just have to wait it out and it will go away on it's own.

I do still have a noise problem eminating from the automatic heater control. When I get fed up with it, I just turn off the heat ir air. If you do not find the problem, try a ClearSpeech (DSP) speaker. It fixed my problem in the interim until the noise went away on it's own. Now I do not need the ClearSpeech speaker, but I keep anyway.

The antenna icon on my FT100 doesn't show which
direction the antenna is traveling. The antenna
animated icon is the same whether the antenna is
extending or retracting.

From: n3jpu
Topic: 11587  Message: 11594

Magnacor KV-85's did wonders for my V-8 Land Rover engines spark noise. From S-7 with the NB on to S-0 with the NB off! That was with a IC-706 and the FT-100 was much less suseptible to it with it's NB. You must have a pretty health spark!!

Hey Jerry.....Get ahold of the RFI ARRL book by Ed Hare. It has a great chapter on mobile RFI problems. In the alternative, you can go to the ARRL website and access a great deal of information. These two sourrces of information really helped me. If your problem is radiated ignition noise, the only "sure" cure is to shield the entire ignition system (not a pleasant job).....73's, Paul, KD5KCZ

# 11597. Re: mobile RFI

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-15 17:27:06 UTC
From: backhoefade
Topic: 11587  Message: 11597

There are many excellent articles on noise "control". Here's my 2 cents worth - just some general observations that I've made in the work place. We design microwave radios which transmit digital traffic. We have to meet various RFI emission limits, some of which are the European ETSI standards which are generally the most stringent for commercial products. We are also faced with the challenge of minimizing RFI cross-talk between different circuits within the equipment. There are two fundamental types of "transfer mechanisms". One is "radiated emissions" and the other is "conducted emissions". You can determine if your "path" is radiated by simply disconnecting the antenna lead from the rig. If the noise (ignition or other) drops nicely then you know it's getting in via the radiated path. If you still see the problem after disconnecting the antenna then you know it's a conducted path which is more than likely via the DC power connection. It can be a combination of both "path" types although one usually clearly dominates.

Once you've determined the "path" then you need to attack the problem at the source. Save your receiver countermeasures for random external interferers and noise (i.e. external to the vehicle). If the path is radiated you really need to kill the problem at the source. You can use shielding, RFI suppression type plug wires and all the other suggested techniques in the literature. If you conclude that the path is conducted then you need to deploy filter solutions which provide attenuation at the receive frequencies of interest on the conducted path, be that the DC power leads or other physical connections to the rig.

This is all easy to yak about. It's when you open the hood, hit your head, ruin the shirt and scrape the third knuckle that things start getting interesting. Speech patterns take on a whole new simplified format (generally mono-syllabic) at that point. Noise is a nuisance but it also ensures employment in the communications work world.

# 11600. Re: [FT100] mobile RFI

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-15 19:01:40 UTC
From: The Simpsons
Topic: 11587  Message: 11600

In this country, USA sourced vehicles are a rarity due mainly to our poor exchange rate. Also, the roads in my area are not very crowded (we don't even have traffic lights in my town (Blenheim) of about 20,000 people). The nearest town larger then here is 90 minutes drive away. On some roads, I can travel for 1 hour and not see another vehicle, though its summer here now so a number of tourists are on the roads. Most domestic vehicles are either Japanese or European. Large American trucks are popular (they're reliable and parts prices are reasonble) for freight haulage.
I have been lucky with the Isuzu and its lack of noise. My Toyota Diesel powered van is not so quiet. The instrument regulator proved difficult to suppress until I added small, about 5 microhenry, chokes inline with the dc feeds and bypassed to ground with 10nF capacitors. The chokes or capacitors on their own did nothing. The same with the windscreen wipers. Previous petrol powered vehicles have usually responded to bonding of everything quite well. The worst case some years ago required a metal cover to be built to cover all the ignition system, with screening of the leads as well.
Perhaps we need a group to discuss the trials and tribulations of vehicle suppression! It's almost a black art completely quitening some vehicles.
For a challenge, try suppressing an outboard motor on a fibreglass boat!!

Grant, ZL2BK.

As I have said repeatedly,go sit on your dealer's desk until he produces a factory rep, and then go sit on HIS head until he produces a fix.

Simply go above 30MHz ( like 35MHz AM ) to get around their stupid ( nothing below 30MHz ) disclaimer...

Folks,
I am stuck out here in Azerbaijan and working as 4K0RF. I have my laptop and FT-100 with me and am trying to key the rig via my computer. Anybody have any schematics or ideas on how to connect the LPT port of the computer to the key jack?
Thanks

# 11607. ant icon

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-15 18:36:07 UTC
From: Jeff kb2m
Topic: 11607  Message: 11607

My FT100 has three different Icon's for the antenna tune function. One has a picture of the antenna all the way down, the next picture has it in the middle, third picture has it at the top. It the antenna is moving up , rig display's the picture all the way down, then in the middle, then at the top, it then skips the middle one and start's at the bottom again. This gives the impression that the antenna is moving up. When it is moving down it display's the top, middle , then down, then skips the middle and does top middle , down, giving the impression that the antenna is moving down. It work's so well that I can see while driving, which direction the antenna is moving.
I had brought this up to begin with , to see if the problem was with the radio or the ATAS, thinking that perhaps the Icon movement was an indication the problem was with the radio. My FT-100 has a mid 2001 build date.

FCC Part 15 requires that electronic devices not emit unintentional RF radiation above a specified level. We have an outdoor test range for this measurement. Just for kicks one afternoon we had one of the techs drive his Yamaha RD400 (electronic ignition) onto the test range. That thing was more than 20 dB out of spec. Heard he got pulled over by the FCC on the way home that night.

Hi Jim,

PSK works great on the FT-100D. I usually run 20 watts but have
boosted it up to 100 watts when 80 meters was in bad shape.

I agree about the clear speech speaker. I use it as an extension to
make the audio cable reach my mike input on my laptop. If you do
that, make sure the switch is off or you won't copy anything.

# 11613. what FT100 problems

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-16 03:27:15 UTC
From: bob frick
Topic: 11613  Message: 11613

Hi to the group,
I've had my FT-100 for over two years and havent had a
problem. I used it for one year in EL2 land as my primary (and only) rig . Run RTTY/PSK/SSB in conjunction with writelog software and CW if PK232. M only problem is this darn cw interface circuit, hence the Pk232.
Will be mounting it in my mobile this summer when I get home so I guess that is when the fun starts.

From: robert blumenkranz
Topic: 11606  Message: 11615

Use VOX mode if you have it with your HF transceiver
while in the SSB mode. This allow you to use a tone to
key the transmitter on CW with a free program like
hamscope. Full break in is possible with no hardware
connection to the rig.

# 11617. simplex repeater on FT100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-16 18:47:12 UTC
From: Pres Waterman
Topic: 11617  Message: 11617

I would like to have a simplex repeater ( the Radio Shack mini one )
connected to my FT100.

The Radio Shack unit is expecting to plug into an HT, so it has a mini-phone
plug for speaker audio INTO the repeater. It has a submini phone plug to
connect to an HT mic socket. It drives the mic by providing resistance
across the mic "hot" connector for PTT purposes, in a modern 2-wire fashion.

What does the FT100 need to be connected properly?

Thanks

> First, how does the FT-100D work on PSK? Any tricks?
> How much power is safe?

I can give you both hints and best/safest PO. First the PO. Try to keep the PO to around 50 watts or less. There are some who are inconsiderate of others and willpush it to 100 watts in PSK and will destroy the Bandpass for everyone else and generally make everyone else on the band miserable with a WIDE, Dirty signal. Some do it without realizing it and some do it without caring about anybody else in a QSO.. Kind of a soap box subject with me so I'll stop now before I pis* someone off.

Now on to the hints. Use SSB either upper or lower depending on the band for PSK, HELL, MFSK ect. DO NOT use the Digital mode. I do not use the ALC meter as a referance on my rig it is all but worthless. With a reading of 4 bars the IMD is terrible and I pride myself onhaveing a clean signal. Use the AFSK level adjustment in the rig's function menu # 28 to clean up the signal. In my FT 100 the level varies and always has from band to band so I vary the level from 13-17. I can help you out on just about anything dealing with running SC digital on the FT 100 as I have been doing it for over 2 years now and have run just about every PSK and multi-moded sodftware out there over that period of time, so please feel free to email me direct for help or with any questions you might have (this goes for anybody by the way) and I will be glad to help.

>
> 73, Jim/nn5o
>
Now on to the Clear Speech subject. I have not had the money to play with one of these but I am happy as heck with the FT 100's DSP and intermod rejection that I have never even considered the need for one.

Hi Rich here, offering this stuff to my fellow FT100 affectionados first.

Changing radios here so my FT100 WITH fan and swr mod is up for sale (serial 9E).500hz cw and AM filter installed,fts decode installed,hi stability osc installed,dtmf hand mic. I can demo this rig on any band so call it and I will be there. The rig is in nice shape and sounds awesome on the air. In fact it sounds so good that Yaesu USA sent a covert operative to my house to see why. I think it may have been Lara Croft..
I have the original box and the stuff it came with when new. $700 shipped with all internal accessories listed above.

I also have an ATAS100 for sale with the original box. Both work FB but the wife picked me up a new rig (TS-2000 silver box version) for the car so they are not needed anymore ( Rule #1 never say no when the wife buys you ham gear!!.) I will take $220 shipped for the ATAS

In addition, I have all of the options available, separation kit,quick release bracket,modem cable, data cable, swivel mount for the head unit.. If you want a super package deal let me know as I wont sell any off the accessories until the rig is sold.

Please email ss409ss@... Tnx Richy N2ZD

Hi, You Just Use The FT 100 software. Plug the radio antenna tuner lead into the standard lead supplied (by Yaesu)into the serial com port on the PC and another switching lead into another com port, (but of corse you must be using a good software programme that has this facility) ... It's called "mini stereo"

I'm not kidding.

Also look for 3.5mm or 1/8" stereo. But the word "mini" is accurate

Date: 2002-01-18 04:40:35 UTC
From: backhoefade
Topic: 11626  Message: 11628

You have two viable choices:
1) Find someone who can repair the PA for $250 or less.
2) Try a different rig. The 706 has its faults too so I don't know which rig to suggest. For mobile I would be leary about the 706's noise blanker.
$550 seems like too much dough for an FT-100 repair. You can only get about $600 or so for it on the used market when it's running perfectly.

A new FT100D is only around $850 so why would they
have to charge $550 to repair one? That sounds way too
high. Has your warrenty run out? Maybe you can
purchase a new RF board and put it in yourself. A used
FT100 may be cheaper than the repair cost.

Check out avvid.com, he has an excellent repair reputation but the final itself from Yaesu is very expensive. (I am guessing its the vhf/uhf final you are speaking of.) You can do this job yourself as its easy to get at but expect to pay over 200 bucks for the final. Yaesu has been known to quote high on repair prices. The offered to fix finals on an FT980 for a friend for only 700 bucks, what a bargain!!
If you want, pick up the final from Yaesu and give it a shot, its real easy to get at but make sure you have the fan mod to keep the new one cool. If you want Lee, contact me by email and I will walk you thru it. Regards.. Richy N2ZZD

Will do, awaiting the rig now, I dont know if it comes with the control head though, gotta call them up. I know they (Kenwood) are throwing it in but I dont know if its an "in store" rebate, I may have to wait for it to come from Kenwood direct. I Cant use it mobile without the head unless I chuck my Laptop up on the dash. I am sure the troopers wont like it if I did. :-)

I have heard some complaints about soft rx on the UHF VHF portion of the TS-2000, but I dont do too much there anyway. I will pass a review along when its installed. Anyway, If it doesnt work out, one of my original FT100's is waiting in the wings, my friend I sold it to is not using it so I can go grab it back at any time.

Tnx Richy N2ZD

# 11633. Replacement rig received but more trouble

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-18 07:22:32 UTC
From: John McClain
Topic: 11633  Message: 11633

The replacement FT-100D arrived a couple of days ago. The new one (s/n 1G) is also displaying the SWR ICON after a tuning cycle in the truck with the ATAS-100 antenna and in the house with a FC-20 tuner and a vertical antenna but it does tune to a low SWR OK.
If this wasn't bad enough, I am also receiving bad reports on the xmit audio when I am in FM mode. I did some experimenting with a friend and found that my audio contains a lot of hi's and a lot of wind blast on when I speak directly into the mic and sounds OK when I hold the mic about 3 inches away which is not the way I am used to doing. None of the menu options change this symptom. If I vary the FM MIC GAIN from about 70 down to 10 the noise and wind blast are still there but at a reduced level. Same goes for the deviation, 2.5 and 5 give the same results. The MIC DSP option doesn't have any affect on the noise either.
The above holds true both in the truck with engine running and not running and in the house on a regulated supply. It acts as though the first stage, prior to the MIC GAIN stage, gets over driven. The schematic shows that the output of the mic is a straight wire all the way to the input of a chip so there doesn't appear to be any physical adjustments to the MIC GAIN, only the one performed by the processor from the menu option. I am considering opening the mic and inserting a 5-10 K resistor in series with the audio and then crank up the MIC GAIN a bit and see what happens.
I am getting good reports on my SSB audio so that pretty much disproves my ideas about the first stage being over driven.
Do any of you experienced FT-100 users have any other ideas?

Hope this is of interest to some.

I just got my FT100D back from Yaesu in California. I'm happy to report that it looks as if they successfully repaired my "deaf RX" problem after warmup that George AH6BV so ably described (below) and several others have reported on this list. I've warmed it up and had it on now for 24 hours. So far, it hasn't lost any RX sensitivity. Hooray!

From the invoice it appears that the only part replaced was one "A08980048". I don't have the service manual or detailed parts list so I can't describe it further. Can anyone shed some light on what component this is in the schematic? Is it in the physical area to which George seemed to narrow down the problem with his heat/cool testing?

I'm a happy camper once again. Thanks to the Customer Service team at Yaesu for a quick turnaround after I had to return it to them again after they missed it the first time.

G'day group,
Richy goodluck with the TS-2000, and the few I have heard on air sound excellent. I suppose if I was looking to purchase a all band base rig, I would strongly look at the 2000.
I am off on the 4th of next month to Reno NV, so I will keep an ear out on 17 metres for you. I think I will be mainly operating on 15 (21.295) and 10 metres (28.500) as these are the only HF frequencies (plus 80 metres) I am license for. I do not know how my brother is going to react when he finds out there will be a few wire antennas strung up around his new house. I maybe taking my Outbacker antenna which will come in handy for when I will be driving around the desert looking for a spot to do some handgun shooting. Also I will try some portable operating around Lake Tahoe and maybe throw a longwire over a giant cactus.
Goodluck, Anthony vk2new.

First thing to do is to check for the swr mod, lift the top cover and match it to the pics posted in the files area. Anyway, the rig sounds like it doesnt have it done. Forget all of that nonsense with adding resistors, the rig should sound fine without any experimentation beyond menu settings with that mod. Your problem is the classic symptom of the rf entering where it shouldnt. The distorted audio,swr icon, foldback etc.. Classic signs the swr mod is not done or done improperly. Yours seems (assumed) to be right on the cusp of May 01 rigs "without" the mod if you lift the cover and dont find the mod done.
Let us know.. Richy N2ZD

I have a similar problem with a brand new FT-100D with
the SWR indicator coming on every time I do a "TUN"
command. In my case I have found that the ATAS-100
appears to be working fine with very low SWR on all
bands but the rig can never find the low dip because
when it stops tuning, it reverses direction for about
.5 seconds which is long enough to cause the antenna
to go way out of resonance. The ONLY way I can tune
the ATAS-100 is by manually overshooting the resonant
point and watching the the antenna return to
"hopefully" the dip. I am going to have the radio
replaced tomorrow at HRO and I will see if that clears
up this problem. As for your mic noise maybe the mic
element is not seated well inside the mic case. Maybe
a bit of foam inside the case between the mic element
and the open hole may help.

Sounds right to me, the part itself (assuming its the VHF/UHF final) is very expensive. Usually Yaesu quotes high but in this case the end result will be dang close to the quote. Heck, you can replace the VHF/UHF final with an 3cx800a7 Eimac for that price! Problem is the Eimac wont fit under the FT100's cover otherwise they may have used it :-) Regards.. Richy N2ZD

# 11642. Mysterious HF Power Output While Operating 2 meters.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-18 19:20:18 UTC
From: szastoupil
Topic: 11642  Message: 11642

Hello. I just received my FT100D from HRO yesterday. I am very pleased so far and have made a few contacts on it. I wanted to try out the 2M FM and see if I could hit a local repeater. So I decreased the power output of the 2M so the menu said "5". I connected my rubber duck antenna to the proper 2M/440 pigtail since that is what I had at hand. The local repeater came back ok, but I noticed that my SWR/Power meter that is hooked to the HF/50M antenna deflected indicating power output. It shows power output on the HF antenna when I'm transmitting on the 2M/440 antenna. I don't think I have an RFI problem with that low of output power. So I thought I'd experiement and turned the HF, 50Mhz, and 440M power to zero. I still had power output on the HF antenna when transmitting on 2m FM. Any thoughts or experiences that anyone could share? Thanks for your time.

John ...Make these changes from the defaults if you
have not done yet...Note the default settings of
these menu options and then adjust them as follows...
Almost gave up on my tx audio with the stock mic,
but this worked out well...
MENU:
25, 40
26, 45
27, 40
33, 5
62, +050
63, +050
64, -200
65, -200

These settings were done by a friend of mine on a
service monitor after
MANY hours of playing to get the best sound that he
could get out of the
radio. His voice has a higher tone than mine and the
same settings work for
both of us and many others in my area. Please look at
your settings and
give these a try and see if it makes a difference.

# 11649. Re: [FT100] FT-100 PA repair

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-19 00:56:59 UTC
From: signup
Topic: 11626  Message: 11649

Well, I want to thank everyone for your comments on this matter. I spoke with Yaesu and they said that this condition could occur from one of two things:

1. Operating with High SWR.
2. Operating more than 50% duty cycle.

Well the radio has been used mobile with the Yaesu ATAS-100 which is autotuned ... and operating SSB or repeaters should not have exceeded the 50% duty cycle ... So, they are at a loss as to what happened, but feel confident, that if I spend an additional 550.00 the PA won't go out again .. even though .. they don't know what caused it this time ...

I am very disappointed, the radio was just over a year old, had less than 100 hours on it and cost close to 1000 dollars. This was my very first Yaesu HF radio. I will never buy any more Yaesu products.

After a lot of deliberation, I have decided not to repair the FT100 -- instead I will sell it and the ATAS-100 for scrap on eBay. Tomorrow I will go into town and by an Icom-706Mk2G for $ 300 more than the repair price and it comes with a 1 year warranty.

Thanks again and I'll be disconnecting from the group shortly.

Maybe because they are not part of the standard tones.

Anybody have an idea why pl tones 206 and 254 are not included in
the selection of available CTCSS tones ? Just curious.

# 11652. Re: [FT100] old topic still need help, hidden menu

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-19 13:22:22 UTC
From: Lee Devlin
Topic: 11646  Message: 11652

Are you holding all three buttons down when the radio
is turning on? The buttons must be held down while
the radio is off, and keep them down while pushing the
power button. Then after the radio is on, let go of
them and then hold in on the FUNC key for 1/2 seconds
to get into the menus. Then scroll down past menu
item 1 to get into the hidden menus.

If this isn't working, you might consider resetting
the radio using the procedure in the manual.

# 11654. Re: [FT100] FT-100 PA repair

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-19 15:29:09 UTC
From: Stephanie Steele
Topic: 11626  Message: 11654

For what it's worth, when my PA failed the radio was 10 months old and had never been out of the box. It failed the first time I used it and there was no high SWR. I ran it on HF for about 30 minutes and it worked fine. I then tried VHF which also worked fine and it then failed the first time I keyed up on UHF. The whole radio got hotter than a pistol as soon as I keyed up on UHF and I had to unplug it. Yaesu told me that 'these things just happen sometimes'. Thankfully mine was repaired under warrant as the repair ticket had a $550 price tag. I have had no further problems with it but I do believe that this is another known weakness in this radio. I would not give up quite so easily as I think you could get them to extend coverage or at least provide free labor to make the repair. The PA chip I believe was quoted at $235 or so which hurts too. Maybe you could also put together everyone's story who has had their PA fail and use this to your advantage somehow. Good luck.

# 11655. Re: Finals Repair???

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-19 17:10:12 UTC
From: Gary Gadwa
Topic: 11655  Message: 11655

All this talk of really expensive PA repair to the FT-100 has me concerned. My early 9F serial FT-100 finally had a VHF PA failure so sent it off to Yaesu for likely VHF PA module replacement and I ask for FAN Upgrade to keep this from happening again.
So can someone tell me what it "actually did" cost for VHF PA replacement?

My FT-100 has worked flawlessly in hard service for over 2 1/2 years. Concerned about the repair costs but still love that FT-100.

# 11656. Re: [FT100] Replacement rig received but more trouble

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-19 17:48:52 UTC
From: John McClain
Topic: 11633  Message: 11656

This is one of the first things I did. I went back through the list and found where these settings and entered them into my rig but they did not change the symptom. Since I posted my last message, I have made a few experiments with several people. One person spoke into the mic on his FT-100 the way I do on mine and experienced the wind blast and overdriven audio that people are complaining about. He feels that all FT-100's are this way and that the operator must learn to speak into the buttons on the mic and not the three small holes at the top of the mic. Next week I am going to switch mics with someone else and see if there is any change in my audio.
Has anyone ever loosened or removed the PC board in their mic? I need to move mine aside so that I can remove the mic element so that I can place a piece of cotton in front of it but the PC board doesn't want to move. I have removed the three screws holding the board but it is still being firmly held by something else. Does anyone have an ideas?

Subject: Re: [FT100] Replacement rig received but more trouble

John ...Make these changes from the defaults if you
have not done yet...Note the default settings of
these menu options and then adjust them as follows...
Almost gave up on my tx audio with the stock mic,
but this worked out well...
MENU:
25, 40
26, 45
27, 40
33, 5
62, +050
63, +050
64, -200
65, -200

These settings were done by a friend of mine on a
service monitor after
MANY hours of playing to get the best sound that he
could get out of the
radio. His voice has a higher tone than mine and the
same settings work for
both of us and many others in my area. Please look at
your settings and
give these a try and see if it makes a difference.

Topic: 11626  Message: 11657

Lee,
I can certainly understand your frustration.
Did you get a clear definition of 50% duty cycle. I
personally don't know what the heck that means.

Also, is the only problem that the solid state power
components are wasted? Seems that could be replaced at
component level, not requiring replacement of the
whole board.

Having been in sales quite a while, I've observed that
many inside support people just don't understand that
it takes at least 4 times longer and 4 times the
expense to get a customer back than it did to get that
customer in the first place. You'd think that they'd
want to protect their market share.

Good luck with the ICOM ...

Normally, 50% duty cycle refers to something like 1 minute transmit, 1 minute receive (to give the rig time to cool down between transmissions.) Back in the 80's I had a 70 watt Kenwood 2 meter rig (the 2570) that I believe was rated at 25% duty cycle (in the manual it stated 1 minute transmit, 3 minutes receive!!) Most of the time, if the fans are working, rigs can be pushed a little harder than recommended...the rating has a margin for error, but gives the manufacturer an excuse to fall back on.

It seems that none of the service personnel at the amateur manufacturers are trained in keeping customer goodwill. They all seem too concerned with the service department making money.

# 11659. VHF Final Amps

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 00:10:44 UTC
From: k5btk
Topic: 11659  Message: 11659

Okay! I knew from the group about the BIG TWO problems which seem to keep resurfacing with the FT-100. But like another recent post, the new thread about a $500+ dollar repair bill when this happens REALLY got my attention too! So let me ask two questions.
Looking at the schematic which came with the radio, it looks to me like all of the fan control takes place in the fan's ground return. The circuitry seems to control the fan by dropping the return resistance to ground below open-circuit - dropping it very low for full fan speed and not so low for slower speed. The idea of the 50-ohm fan fix is then to shunt a modest resistance across the control circuit to produce a low fan speed at all times - while still allowing the control circuitry to drop the resistance even lower when transmitting. An I reading this right?
Is everyone who has done this "fix" thus far satisfied with its effectiveness? If so, what physical method seems to best allow its later removal w/o taletale warranty-voiding evidence? Perhaps something envolving the removal of the ground-return pin on the little Molex plug which mates with the main board? Or something more direct? Is there a good ground nearby that doesn't require soldering to a pad on the main board?

# 11661. Re: [FT100] FT-100D & ATAS-100 problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 00:55:04 UTC
From: robert blumenkranz
Topic: 11570  Message: 11661

I installed a brand new FT-100D today and I still have the exact problem as before.

I opened the top cover to see if it had the SWR mod installed from the factory which it did but this did not help my problem. The radio and the one before with the problem both were late model FT-100D with 2001 date code in May or June of 2001.

I have a very good ground plane (30ft. roof of solid aluminum of my motor home) and when the antenna resonates it has a very low swr so this is not the problem.

I cannot set the swr to null using the "tun" command because the automatic mode always lands on a hi swr point, usually I have to manually move the antenna in the up direction and allow it to overshoot the dip, then I watch the antenna move under command of the radio (I have released the button). If I am lucky about 25% of the time, the antenna will move back to near the resonant point. This takes several tries manually up and down trying to hit the dip, and it is a real pain.

From what I am seeing there appears to be a microprocessor program error that is making the antenna hunt in the reverse direction after the up/down button is released. If I am corrent then no one with the new radios is going to be able to use the ATAS-100 antenna in the manual mode until this is fixed. I have measured the voltage during manual tuning and observed that the radio is commanding the antenna to reverse after letting up on the up/down button.

Anyone with a similar problem with a new FT-100D and the ATAS-100 antenna please let me know. The only thing I have not done is to try a different antenna. Since the voltage is causing the antenna to move when it should stop I have ruled out the antenna and I believe that it is the new radios that may have been reprogrammed to fix the swr problem and may now be overcompensating.

Any thoughts?

Thanks,
Bob Ni6R

# 11662. Re: [FT100] Replacement rig received but more trouble

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 01:17:18 UTC
From: The Simpsons
Topic: 11633  Message: 11662

I assume you are talking directly into the mic. Try talking across the face of the mic. This will reduce the plosive sounds and also the muffled audio. I have good audio reports with both the FT100 and FT8100 (same model microphones) as long as I talk across the face of the mic. The mic is held almost in contact with my face at the side of my mouth. The mic gain has been reduced to allow for the close speaknig. This also reduces the pick up of any background noise. The bass frequencies are emphasised when talking close and directly into the mic, hence the muffled sound.

> This is one of the first things I did. I went back through the list and found where these settings and entered them into my rig but they did not change the symptom. Since I posted my last message, I have made a few experiments with several people. One person spoke into the mic on his FT-100 the way I do on mine and experienced the wind blast and overdriven audio that people are complaining about. He feels that all FT-100's are this way and that the operator must learn to speak into the buttons on the mic and not the three small holes at the top of the mic. Next week I am going to switch mics with someone else and see if there is any change in my audio.

The antenna extends when the voltage exceeds 10.4V DC and retracts when the voltage falls below 8.4V DC. It sounds almost like the voltage is falling too slowly and thus causing your antenna to start retracting for a while after it has found a match. If you have the equipment, it would make sense to see if the antenna has something wrong with it by running it with a variable DC supply. Don't run it to the stops, because you don't want to stall out the motor but see if you can determine if it continues to move or switch direction after you remove the voltage source. It seems almost like there's a storage capacitor in the antenna, and you can't shut down the voltage fast enough as it swings down past 8.4 V and thus it reverses direction and retracts.

Does it work the same way when you're retracting the antenna? That is, does it retract and then reverse direction and extend for a while or does it only do the motion reversal after it's been extended?

Believe me, what you are seeing is not normal and I can certainly understand your frustration. The antenna is supposed to tune automatically. That is what makes it convenient. A motorized antenna that you have to tune manually isn't convenient. An antenna that works *against* you as you're trying to tune it is downright frustrating.

The next step would be to isolate whether it's the rig (i.e., some firmware bug) or the antenna. I'd be very surprised if it's a firmware bug as we'd expect to be hearing a lot of users on this forum with the same problem, (unless, of course, you have the first

one...)

Since swapping out the rig didn't work, ask the shop to swap you for another ATAS. That would certainly be a quick test to help in determining if the antenna is to blame.

Bob

You say this is a motor home.
How long is your antenna cable? It could be too long causing a
voltage drop not allowing the antenna to function properly.
Try testing the antenna with a shorter cable.

Just a thought !

The FT100D/ATAS100 has the performance and features I want but all these problems, ATAS tuning, high SWR, and blown finals have put me off of getting one. I realize many have had good luck with their rigs and I wouldn't be too concerned about the possibility of having a problem if it wasn't for the infamous Yaesu customer service and their heinous repair rates once the unit is out of warrantee.

Evidently, some of the most recent builds (1H and later) have the high SWR fix. I've heard that some have a thermal switch installed too. What build date did they start installing the thermal switch and are the high SWR and blown finals problem now solved?

John,
Here is a clear deffinition of 50% duty cycle. In the case of FSK
transmissions such as packet, PSK, HELL and the other SC digital modes
50% duty cycle means the power out is set to 100% BUT you do not put
out more then 50 watts or 50% of 100. In the case of 2mtrs this is
25 watts for Packet and other modes. I set mine up for HSCW and HSMS
for 20 watts out of the rig and drive the 200 watt amp with that.
This way the rig stays cool and the PA is not strained in the least I
hope this has cleared up your confusion about 50% duty cycle.
73 and all the best

# 11672. good experience

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 05:26:33 UTC
From: Pres Waterman
Topic: 11672  Message: 11672

I would just like to tell the group of a good experience.

I jsut installed my ~2 year old FT100 and ATAS-100 into a new 02 Escape. I had my techician ground the CQ-5M pigtail to the top of the shock tower I think that's what it's called ) and the mount is at the back of the hood/bonnet opposite the broadcast antenna.

The radio is sitting on the carpet below the driver's seat. There is another ground lead from the thumbscrews I put in the side of the radio, going to the seat anchor.

The remote head is mounted up high on the windshield, behind the sun-visor.

My, oh my, everything is so fine! I have the W2FS QSY'er keypad working for direct frequency entry, and the ignition noise is tolerable. The antenna finds happy SWR dips on all freqs 7-54 MHz. Even the "WARC" bands which are not specified to work.

Life is good.

Thanks

> This is one of the first things I did. I went back through the list and found where these settings and entered them into my rig but they did not change the symptom. Since I posted my last message, I have made a few experiments with several people. One person spoke into the mic on his FT-100 the way I do on mine and experienced the wind blast and overdriven audio that people are complaining about. He feels that all FT-100's are this way and that the operator must learn to speak into the buttons on the mic and not the three small holes at the top of the mic. Next week I am going to switch mics with someone else and see if there is any change in my audio.
> Has anyone ever loosened or removed the PC board in their mic? I need to move mine aside so that I can remove the mic element so that I can place a piece of cotton in front of it but the PC board doesn't want to move. I have removed the three screws holding the board but it is still being firmly held by something else. Does anyone have an ideas?

There is one screw that is hard to see, make sure you have em all, in addition I modded my mic so that the third hole was open, along with moving the disc over the element so that the (now three holes) were exposed as the disc had a section of it removed. This really cleaned up the audio and the reports were excellent. The main reason for messed up audio is the swr mod and ground straps (two), so if you dont have them, dont waste your time messing with mics.. I jabber jaw directly into the mic with the gain set at 63 and the dsp set to 1. Thats it, no hocus pocus talking into a pillow or holding the mic near my sacroliliac or anything. Excellent reports, each and every time after doing the above things.. Regards.. Richy

I LOVE MY RADIO. I LIVE IN TORONTO CANADA, IT'S COLD HERE RIGHT NOW AND MY TRUCK IS OUTSIDE EVERY NITE AND THE RADIO IS IN IT. EVERY MORNING THE RADIO IS COLD AND I DON'T USE IT FOR A FEW MINUTES AFTER TURNING IT ON. MY RADIO IS MOUNTED UNDER THE ASHTRAY WHERE THE BRACKET IS SCREWED TO THE UNDERSIDE JUST IN FRONT OF THE CONSOLE. IT GETS LOTS OF VIBRATION AND BUMPS IN THIS SPOT. I ALSO HAVE THE ATAS 100 ANTENNA, LOVE IT TOO IT'S MOUNTED ON TOP OF THE REAR PASSANGER DOOR WORKS GREAT AND HAVE HAD NO PROBLEMS. I'M IN MY TRUCK 5,6 AND SOMETIMES 8 HOURS A DAY THE RADIO IS ON A LOT OF THE TIME AND BEING USED ALOT.. I'M WRITING THIS REVIEW BECAUSE THIS RADIO PERFORMS FOR ME AND I WOULD RECOMEND IT HIGHLY TO ANYONE. IF IT WERE GONNA SCREW UP I'M SURE IT WOULD HAVE BY NOW. BUT IT CONTINUES TO GET GREAT REPORTS AND DON'T FORGET THIS IS NOT A CB RADIO, I HAVENT DONE ANY MODS TO THIS RADIO AND MY AM SOUNDS NOT TO BAD. PROUD OWNER YAESU FT100D AND ATAS 100 73. P.S. I'VE ALSO OWNED A ICOM 706 AND LIKE THE FT100D BETTER.

The lenght of the cable is about 35 feet but it is
RG8X and there is plenty of power for the antenna. I
did try a short coax on a test fixture with a good
ground and the problem was the same.
Thanks,
Bob

Thanks Lee,
Good comments and yes I have measured the voltage and observed it revesing for about 1/2 second so the motor is being told by the xcver to reverse at the last moment. It is good to know that the problem is NOT normally observed so at least I know that this has not been seen before. I tend to agree with you that it may be a SLOW voltage drop causing the comparator to SEE the decaying voltage as a DOWN command once it is supposed to drop off. I will do some more experimenting on it to see if I can narrow it down. It did occur to me that I should be able to control the antenna with an external DC source and see how it responds. I could hook up a couple of powwer supplies and control it up/down but then that is what the radio is doing. I may try another antenna if all else fails.

Thanks for your suggestions.

# 11680. Re: FT-100 PA repair

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 04:35:34 UTC
From: wb4eje
Topic: 11626  Message: 11680

I just got an estimate of $505 for a similar repair. My rig, after a year of otherwise trouble free operation started showing a Hi SWR indication on the display. I checked the antenna and it was fine. I put the rig on the bench with a Bird watt meter, frequency counter, and dummy load. I found the final was oscillating about about 200-300 Mhz when the Hi SWR was displayed. Then, the rig blew the fuses. Seems it developed a low impedance short across the power input. Turns out the one of the final FETs was blown and the UHF/VHF module. How could it blow out both at the same time ???

Looking around on the web, I found that the oscillation problem was common and Yaesu has a fix for it. I think you can probably find links on this group to photos describing the fix. Seems they used copper tape stuck to the chassis for making ground connections and after some time the tape begins to fail. The fix was to use a screw into the die-cast chassis for the grounding.

So, Yaesu telling you that the cause was operation at hi swr was correct, but I don't think they are telling the whole story. The rig has built in turn down to protect the finals from hi swr. However, if the rig goes into oscillation the turn down does not protect it.

I have also elected not to repair my FT-100. I'll either sell it for scrap or fix it myself....probably should have done that in the first place rather than waiting 9 weeks for an estimate from Yaesu!

This is not my first Yaesu, I have a number of them including a FT-817 and a FT-847. But, it will my last if they don't give me some accommoditation on the repairs. I have written a couple of emails to the that have been ignored....I am going to try to get someone on the phone and see what can be done.

Subject: [FT100] good experience

I would just like to tell the group of a good experience.

I jsut installed my ~2 year old FT100 and ATAS-100 into a new 02 Escape. I had my techician ground the CQ-5M pigtail to the top of the shock tower I think that's what it's called ) and the mount is at the back of the hood/bonnet opposite the broadcast antenna.

The radio is sitting on the carpet below the driver's seat. There is another ground lead from the thumbscrews I put in the side of the radio, going to the seat anchor.

The remote head is mounted up high on the windshield, behind the sun-visor.

My, oh my, everything is so fine! I have the W2FS QSY'er keypad working for direct frequency entry, and the ignition noise is tolerable. The antenna finds happy SWR dips on all freqs 7-54 MHz. Even the "WARC" bands which are not specified to work.

Life is good.

Thanks

I know! Thought I'd rock some worlds!

Try a truckstop or CB place, you know, the kind of place that sells Transel brand stuff on red packages.

I think they are 4mmX6mm length, there should be a sticker on the side of the radio saying 4mm or m4x6

If no luck, try http://www.tandmelectronics.com

John,
Here is a clear deffinition of 50% duty cycle. In the case of FSK transmissions such as packet, PSK, HELL and the other SC digital modes 50% duty cycle means the power out is set to 100% BUT you do not put out more then 50 watts or 50% of 100. In the case of 2mtrs this is 25 watts for Packet and other modes. I set mine up for HSCW and HSMS for 20 watts out of the rig and drive the 200 watt amp with that. This way the rig stays cool and the PA is not strained in the least I hope this has cleared up your confusion about 50% duty cycle.
73 and all the best

From: Jeff kb2m
Topic: 11570  Message: 11684

When I installed my new FT-100 , and used ATAS antenna in my 98 Ford Exploder I was experiencing some symptoms similar to what your seeing. I spent the afternoon grounding the ATAS, jerking around with the coax length etc. I then noticed by chance that the antenna sometimes wouldn't go up, unless the engine was running. The battery measured 12.4 volts, a little weak. I replaces the original battery and the erratic antenna problems went away. I'm using about 15 foot of rg8x, and the FT-100 is fed via 4 gauge wire directly to the battery, both sides fused. You might want to check the voltage to the radio, engine running , and off.

Sorry to disagree, Sandor, but 50% duty cycle refers to TIME, not power. A true 50% duty cycle refers to full power, transmitting half the time, receiving half the time.
I am not saying you should run full power on digital modes!! I am only clarifying the term "50% duty cycle." If Yaesu is referring to lowering power on digital modes, then "50% duty cycle" is the wrong terminology.

73,
Paul K4PDM

I f the moter home is mostly fiberglass this will present a grounding problem for the atas 100 and even with the al roof ( which is the best way to battle this ) keep in mind the frame for the body and stucture ( studding ) may have to be addressed.
GOOD LUCK
W1WQ

Subject: [FT100] good experience

I would just like to tell the group of a good experience.

I jsut installed my ~2 year old FT100 and ATAS-100 into a new 02 Escape. I had my techician ground the CQ-5M pigtail to the top of the shock tower I think that's what it's called ) and the mount is at the back of the hood/bonnet opposite the broadcast antenna.

The radio is sitting on the carpet below the driver's seat. There is another ground lead from the thumbscrews I put in the side of the radio, going to the seat anchor.

The remote head is mounted up high on the windshield, behind the sun-visor.

My, oh my, everything is so fine! I have the W2FS QSY'er keypad working for direct frequency entry, and the ignition noise is tolerable. The antenna finds happy SWR dips on all freqs 7-54 MHz. Even the "WARC" bands which are not specified to work.

Life is good.

Thanks

You only want 25 watts carrier on AM, else you can't modulate it and run it through the 100 watt peak power amplifier in the radio if the carrier is bigger. Then you still may only want to transmit 40% of the time.

>Sorry to disagree, Sandor, but 50% duty cycle refers to TIME, not power. A
>true 50% duty cycle refers to full power, transmitting half the time,
>receiving half the time.

Maybe yes and maybe no. 50% duty cycle means 50% of full duty, full duty being 100W continuous. If you transmit 50% of the time at 100W or 50W for 100% of the time either might be construed as 50% duty cycle.

One thing not adequately specified is how often you have to switch off to achieve a 50% duty cycle. If you TX for a second and RX for a second that's probably 50% duty. But what about TX for 1 minute and RX for 1 minute, TX for 5 minutes and RX for 5 minutes, or even TX for 1 hr and RX for 1hr. All of those are 50% duty, time wise.

> Wow, something actually went well. Don't see much of that around here, do
we? Where did you find the thumbscrews? I have been looking in the local
hardware stores with no luck. Are they 4mm screws?

I know! Thought I'd rock some worlds!

Try a truckstop or CB place, you know, the kind of place that sells Transel
brand stuff on red packages.

I think they are 4mmX6mm length, there should be a sticker on the side of
the radio saying 4mm or m4x6

If no luck, try http://www.tandmelectronics.com

I found that the radio had very fuzzy audio on 20 with the engine off.
The FT-100 input voltage lower limit is very critical.

Subject: Re: [FT100] FT-100D & ATAS-100 problem

When I installed my new FT-100 , and used ATAS antenna in my 98 Ford
Exploder I was experiencing some symptoms similar to what your seeing. I
spent the afternoon grounding the ATAS, jerking around with the coax length
etc. I then noticed by chance that the antenna sometimes wouldn't go up,
unless the engine was running. The battery measured 12.4 volts, a little
weak. I replaces the original battery and the erratic antenna problems went
away. I'm using about 15 foot of rg8x, and the FT-100 is fed via 4 gauge
wire directly to the battery, both sides fused. You might want to check the
voltage to the radio, engine running , and off.

From: Glen Farough
Topic: 11677  Message: 11694

Good to see Flowers on a Great Radio!
But caution...
Make sure that Yaesu has done or you do equiv simple
2 only MODS!
1) Thermal mod for vhf/uhf use
*** Don't let that radio get warm receiving ***
(simple 50 ohm resistor mod, putting resistor between
either black fan lead and ground to make the fan run
slow speed full time) Works well for everyone
2) VSWR mod to curb troubles when the copper tape
ground plays out...(simple tin strap or short pieces
of solder wick) as pictured in mods
That oscillation escalates from false VSWR icons to
PA failures.
So...If you are lucky enough to have these two issues
covered or spend less than a nickel to fix them up...
You will be happy like the rest of us forever!
This note bouncing around about Poor tx audio with
stock mic should be done too...
Pasting...
Make these changes from the defaults if you
have not done yet...Note the default settings of
these menu options and then adjust them as
follows...
Almost gave up on my tx audio with the stock mic,
but this worked out well...
MENU:
25, 40
26, 45
27, 40
33, 5
62, +050
63, +050
64, -200
65, -200

These settings were done by a friend of mine on a
service monitor after
MANY hours of playing to get the best sound that he
could get out of the
radio. His voice has a higher tone than mine and the
same settings work for
both of us and many others in my area. Please look
at
your settings and

give these a try and see if it makes a difference.
(From N4XEO email)
73 de Glen VE7LGF
Good Luck

Those hot humid days comming this summer in Toronto
will take out your little ft100d buddy that worked
so well during the hockey season...
Check out the need for the fan and swr if needed?

# 11695. RE: [FT100] FT-100D & ATAS-100 problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 20:43:35 UTC
From: robert blumenkranz
Topic: 11570  Message: 11695

I am not having a voltage problem but I am narrowing down this problem. I have tested the antenna with a 12 volt battery and when I remove the voltage the antenna stops dead in it's tracks as it should. Running the antenna from the radio in manual mode "always" results in my ATAS going back down about .25 to .5 inches after releasing the "UP" button on the radio. This incorrect down motion is there no matter what length of coax I have and does not depend on the condition of the ground which on my system is excellent. I get a 1:1 match on all bands when the antenna is at resonance.

Can someone please verify the following:

When you Manually move the antenna and release the "UP" button does your antenna stop immedately or does it move a bit in the opposite direction.

So far 2 Brand new FT-100 D that I have tested are unable to control the antenna correctly in the manual mode. This failure is the same in the automatic mode.

I have eliminated the coax length and low voltage as a possible source of the problem. I have tried the radio with a short coax and locating the antenna on a different vehicle roof.

This is definately a DC control problem of sorts that seems to be somehow caused by the radio which is not dropping the voltage to zero fast enough when told to stop the motion of the antenna.

Unfortunately I keep coming back to the radio as the most likely source of the problem. All SWR mods are factory installed as the picture shows so this is not an issue with this radio.

I am inclined to think that the Micoprocessor may have been reprogramed in this run of FT-100 D to do this for some unknown reason since the antenna contol circuit appears to show that the Up/down buttons connect to the micro which then commands the antenna to move. If the antenna move command has a delay or somekind of reverseal of voltage even for a .5 second then this would explain what I am seeing.

Thanks for any help in this matter.

Bob Ni6R

# 11696. The TWO BIG Chronic FT-100 Problems...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 21:31:26 UTC
From: k5btk
Topic: 11696  Message: 11696

Santa brought me a new FT-100D this year! Like many of you guys (based on how many of your calls I see on the other Yaesu groups) I am a confirmed Yaesu fan. My wife knew about my Yaesu enthusuasm and sprung this one on me without my prior knowledge.

A great deal of the bandwidth on most of the newsgroups is of course devoted to equipment problems. I think that's as it should be. We are all concerned about potential problems and possible fixes that might head off disaster. But I suspect that these problems tend to dominate the groups in a way that may lead us to believe that the problems are more widespread than is actually the case. A report of a failure has a tendency to create much longer threads than reports of total satifaction. I really would like to know what PERCENTAGE of FT-100 owners have experienced the BIG TWO problems. Could it be that the MAJORITY of the rigs are offering satisfactory performance?

In spite of the often reported fading LCD display problems reported on the 1000MP user group, my own MP has been well behaved. (I did buy a couple of fluorescent backlight tubes and put them in my parts box just to ward off demons). I bought it because of the mountains of good reports which I saw coming back from DXpeditions, etc.

My 817 has been all I had hoped it would be (after putting in the CW filter). The 847 suffers only from the decrease in satellite activity which followed the last hard-luck launch.

When Santa brought me the new 100D, I immediately corresponded with Yaesu about the lack of periodic fan cooling in the VHF/UHF modes. The technician told me that the "fix" could be installed - but that it is not necessary. Many of the guys are convinced that this response is all part of a conspiracy to hide a problem which Yaesu wants to ignore. But I think it's just possible that Yaesu has addressed the problem and acted to correct it. I sure hope so!

My rig (Serial 1G...) came with the SWR modification. Is it possible that the BIG TWO problems are in reality the SAME problem? Could it be that the stray VHF/UHF oscillation that the unmodified rigs have broken into produced BOTH the high SWR indications AND were resposible for the fried VHF finals? If so, then perhaps eliminating the spurious oscillation eliminates the need for the cooling modification. I hope that both problems disappear with the grounding mod.

# 11697. ATAS & FT100D problem resolved

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 21:42:11 UTC
From: robert blumenkranz
Topic: 11697  Message: 11697

After hours of testing here is what I have discovered.
The new FT100D radios put out the following voltage to
the antenna:
UP 10.4v RElease Up button 9.2v for about .5 sec.

Down 7.2 REelase Down button 8.2v for about .5 sec.

This voltage is the control voltage to the antenna and
it is sent to control any up/down motion of the
antenna. The problem is that in my NEW combination of
FT-100D and ATAS, the comparator inside the ATAS
antenna is not being given two distinct voltages as
should be the case for the comparator to do the
control without reversing. This is causing the
reversal in direction momentarily after either UP or
Down control.

Online Spec info on FT100 group site suggests the
following:

"According to the values of the voltage divider
circuits shown in the technical supplement +8.4V
applied to the coax causes the ATAS-100 to retract,
and +10.4V or more will cause it to extend"

In my case the antenna is reversing direction when the
voltage stops for a .5 second after the correct
voltage is being sent. It appears that the comparator
is unable to ignore the residual voltage coming from
the radio which results in reverse motion.

Having discovered that this is the case I am
interested if anyone can verify the voltage seen going
to the antenna to see if the voltage does
look like what I have seen listed above. If I can
verify this then maybe I will exchange the ATAS
antenna and hope that a new one will be able to ignore
the voltage step coming after the release of the
contol button. Otherwise Yaesu will have to redesign
the comparator inside the to work under
these voltage ranges if that can be done considering
that it should NOT be happeing!!

Thanks,
Bob Ni6r

From: John Spiceman
Topic: 11626  Message: 11698

Thanks to all for helping to shed some light on the
50% duty cycle thing. Someone initially mentioned this
figure being in the manual. Guess I missed it ...
still can't find it in there.
I use my FT100 a lot for 10 mtr AM. A true AM
conversation is long winded so the 50% duty cycle gets
thoroughly tested. You just have to pray that there
are a lot of people also in the QSO so you can hit the
50% :-)

# 11699. AM Negative Modulation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-20 23:20:53 UTC
From: jrmorris28
Topic: 11699  Message: 11699

Was talking on AM yesterday and a friend close to me said my carrier was "full quieting" but there was little audio when I modulated. Hum.. Well, sure enough, I brought the FT100 into the shack and hooked up the power meter.

Sure enough, when I keyed the transmitter, the carrier went up to 25 watts as required. Then when I modulated, the output went down to 5-10 watts. The ALC seems to be kicking up quite high which is probably the reason for the output dropping off. Did this on the ATAS100, base station vertical and dummy load.

Any ideas as to why this would be happening only in AM. SSB, FM and CW still put out full power? I thought maybe I inadvertently changed a function setting but I've been through all regular and "F".

If it was rf feedback, it would affect all modes. There is NO ALC setting for AM mode only, is there? I'm stumped !!!

Thanks guys,

John - WB0RLD

> 100W continuous.
With all respect, I would like to know the source of your definition. Duty cycle is always specified at full power unless otherwise noted. I searched for definitions, and the first one I found was:
"Duty cycle (or duty factor) is the measure of the fraction of the time a radar is transmitting." This from a Navy website.
None of the definitions referenced power level, and neither have any of the ham usages I have seen.
Back when ham radio was more technical, rigs specified duty cycle AND maximum key-down time. If I remember right, the Kenwood 940 specified a 100% duty cycle for a period of one hour. Obviously, the duty cycle specification is more useful when the maximum key-down time is given, but the duty cycle is always specified at full power.
Transceivers draw varying amounts of current at reduced power, and while reducing power will reduce the heat dissapated, the amount will vary from rig to rig.
Maybe you think the definition of "duty cycle" is open to interpretation, but it does have an accepted meaning, and that is with full power output, unless otherwise specified.

>
> Down 7.2 REelase Down button 8.2v for about .5 sec.

I think you figured out the problem. The comparator circuit inside the ATAS is malfunctioning. I ran some tests on the bench just now and confirmed that the ATAS retracts when the DC voltage falls below 8.4 V and extends when the voltage exceeds 10 V (not 10.4 V which is incorrect in the FAQ so I'll fix it).

So, there is a range of voltages inside 8.4 and 10 volts that cause no antenna motion. I believe that the radio applies this 'safe' voltage for a .5 second period after you release the up/down buttons or after an autotune event. I have a digital volt meter and it was so confused by the RF that was present during tuning, that the display just flashed but I did see a DC votage that lingered for about .5 seconds after a I stopped tuning that was in the neighborhood of 9.4V after I let go of the 'up' button. (Any DC meter is can be confused with such a high RF field superimposed on the DC signal.) I'm betting that the .5 second DC voltage applied after the up/down event will fall in the 'safe' window and cause no motion on the antenna.

Therefore, I think your ATAS should be replaced.

This is a new problem which has never been reported before. It's possible that one of the resistors in the voltage divider circuit inside the ATAS controller is wrong or has a cold solder joint and so you have no 'safe' voltage zone which would normally cause the antenna to stop.

I TOO have a New FT-100D that Santa brought me, with a 1H serial number. Don't know if it has the swr mod but it does great. I have it mounted under the passenger seat with the face on the center console of my Ford Expidition, with the atas mounted on the back hatch with a swivel mount. It has no problems, and even tunes up on all warc bands. I have been getting good reports from others I contact. I have no ignition noise, so I am crossing my fingers and hope nothing goes wrong.

Subject: [FT100] The TWO BIG Chronic FT-100 Problems...

Santa brought me a new FT-100D this year! Like many of you guys
(based on how many of your calls I see on the other Yaesu groups) I
am a confirmed Yaesu fan. My wife knew about my Yaesu enthusuasm and
sprung this one on me without my prior knowledge.
A great deal of the bandwidth on most of the newsgroups is of
course devoted to equipment problems. I think that's as it should
be. We are all concerned about potential problems and possible fixes
that might head off disaster. But I suspect that these problems tend
to dominate the groups in a way that may lead us to believe that the
problems are more widespread than is actually the case. A report of
a failure has a tendency to create much longer threads than reports
of total satifaction. I really would like to know what PERCENTAGE
of FT-100 owners have experienced the BIG TWO problems. Could it be
that the MAJORITY of the rigs are offering satisfactory performance?
In spite of the often reported fading LCD display problems
reported on the 1000MP user group, my own MP has been well behaved.
(I did buy a couple of fluorescent backlight tubes and put them in my
parts box just to ward off demons). I bought it because of the
mountains of good reports which I saw coming back from DXpeditions,
etc.
My 817 has been all I had hoped it would be (after putting in the
CW filter). The 847 suffers only from the decrease in satellite
activity which followed the last hard-luck launch.
When Santa brought me the new 100D, I immediately corresponded
with Yaesu about the lack of periodic fan cooling in the VHF/UHF
modes. The technician told me that the "fix" could be installed -
but that it is not necessary. Many of the guys are convinced that
this response is all part of a conspiracy to hide a problem which
Yaesu wants to ignore. But I think it's just possible that Yaesu has
addressed the problem and acted to correct it. I sure hope so!
My rig (Serial 1G...) came with the SWR modification. Is it

possible that the BIG TWO problems are in reality the SAME problem? Could it be that the stray VHF/UHF oscillation that the unmodified rigs have broken into produced BOTH the high SWR indications AND were resposible for the fried VHF finals? If so, then perhaps eliminating the spurious oscillation eliminates the need for the cooling modification. I hope that both problems disappear with the grounding mod.

Use VOX mode if you have it with your HF transceiver
while in the SSB mode. This allow you to use a tone to
key the transmitter on CW with a free program like
hamscope. Full break in is possible with no hardware
connection to the rig.

I use a Hi-Q Stealth 2000 on 3.2 to 50 Mhz without a SWR problem and this is on an non D version. But I do have an extra 10' of RG-8X with about 10 ferrite beads on the end that connects to the 100, that has helped a lot.

```
=========================================================
Paul, et al,

Just to be a wee bit redundant: For commercial transmitters, 50% duty cycle
meant half the time on, and half the time off, as averaged over 5 minutes.
The "averaging" time is the one that varied amongst various specifications.
The power was always maximum rated power.
For our radar sets, the "averaging time" was "continuous", no minimum or
maximum time specified, as suggested from the prior message. Typical radars,
of course, might have pulse repetition rates of 300-3000 pps, except for
long range and OHR.

MAYBE. I was thinking of this. As the antenna extends or retracts to find the low SWR point, isn't it reasonable to presume it would go just past the dip ( thus establishing the dip point ) and then back up to find the lowest point?

I can say that visually observing the tuning it does NOT pass and back up, but I would think it should. Otherwise, "how low is low"?

# 11708. Re: [FT100] of 50% duty cycle

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-21 15:21:52 UTC
From: lhlousek
Topic: 11708  Message: 11708

Don't want to beat a dead horse here but I was not disputing the fact that strict definitions of duty cycle exists. My point was the unless we know how the amateur radio division of Yaesu defines it, it doesn't give operators of the equipment much guidance and it allows Yaesu to use it as an excuse to not honor their warrantee.

A spec like "50% duty cycle averaged over 5 minutes" implies a maximum continuous transmit time of 2.5 minutes because that's the longest possible continuous transmit time you can fit into 5 minutes and still average 50%. To my knowledge Yaesu doesn't specify the averaging time so we don't know what the maximum continuous transmit time is. Further, as good a spec as "50% duty cycle averaged over 5 minutes" is still provides no guidance on what do at less than 100% power. Certainly 50% duty at 100% power is not the same as 100% duty at 50% power but many mfgrs will specify that the rig be run at a particular reduced power for high duty digital modes. This implies that permissible duty cycle goes up as power goes down.

So my point was that 50% duty as specified by Yaesu is not enough to tell us how to operate the radio.

Scott,

Check the 100D's menu for ATAS operation. You may have it set for diplexer connection. I believe w/ 2 antennas (1 for HF and 1 for 440/144) the menu is "ATAS2" The other possible choices "None" "ATAS1" and "FC20" are NOT interchangeable. You must have the right one selected. Hope this helps - Steve K1SJC

Subject: [FT100] Mysterious HF Power Output While Operating 2 meters.

Hello. I just received my FT100D from HRO yesterday. I am very pleased so far and have made a few contacts on it. I wanted to try out the 2M FM and see if I could hit a local repeater. So I decreased the power output of the 2M so the menu said "5". I connected my rubber duck antenna to the proper 2M/440 pigtail since that is what I had at hand. The local repeater came back ok, but I noticed that my SWR/Power meter that is hooked to the HF/50M antenna deflected indicating power output. It shows power output on the HF antenna when I'm transmitting on the 2M/440 antenna. I don't think I have an RFI problem with that low of output power. So I thought I'd experiement and turned the HF, 50Mhz, and 440M power to zero. I still had power output on the HF antenna when transmitting on 2m FM. Any thoughts or experiences that anyone could share? Thanks for your time.

In the "Olde Dayes" of AM, we attribuyed that phenom to "Over Modulation". Try turning down the Mike Gain.

Subject: [FT100] AM Negative Modulation

Was talking on AM yesterday and a friend close to me said my carrier was "full quieting" but there was little audio when I modulated. Hum.. Well, sure enough, I brought the FT100 into the shack and hooked up the power meter.

Sure enough, when I keyed the transmitter, the carrier went up to 25 watts as required. Then when I modulated, the output went down to 5-10 watts. The ALC seems to be kicking up quite high which is probably the reason for the output dropping off. Did this on the ATAS100, base station vertical and dummy load.

Any ideas as to why this would be happening only in AM. SSB, FM and CW still put out full power? I thought maybe I inadvertently changed a function setting but I've been through all regular and "F".

If it was rf feedback, it would affect all modes. There is NO ALC setting for AM mode only, is there? I'm stumped !!!

Thanks guys,

John - WB0RLD

I have ALWAYS talked across the mic. The difference is that the newer mic's
might be more sensitive than the old ones.

# 11713. FT100 and Yaesu service

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-22 00:24:22 UTC
From: fjx1@aol.com
Topic: 11713  Message: 11713

I've been following the thread on the $505 estimate from Yaesu. I have mine at Yaesu now awaiting a quote. I lost output on the lowbands after abt 2 years of good service. The SWR indicator came on, rig got hot and wham no output. There was nothing wrong with the antenna system. A call to Yaesu guesses at a PA or lowpass filter with a ballpark estimate of $140-200. The rig has no mods. Why, I never knew about them until I read it here. Think Yaesu should be responsible to keep owners informed of critical updates (thermal, SWR, poor ground strap). They may reserve the right to improve radios without notice but when it leads to such expensive repairs, such a practice becomes questionable. When a rig fails due to poor design they should be responsible. As a group I wonder if there's something we can do. Can they afford to anger a large group of hams? In 39 years of ham radio I've made plenty of mistakes, but never smoked a final.

Works like the FT-900 AM mode. Put the rig on a monitor scope with a dummy load and you will see that the ALC loop keeps the positive peaks from exceeding 25 watts.

Hey Stan....Just got through with a project like this. If you are an ARRL member, access their "Member" site. There is a great deal of information there in the RFI section and a guideline on how to check out a tentative new vehicle for RFI problems. Also the ARRL publishes an RFI book which has installation guidelines for the various cars manufactured. This book will also be of a big help in eliminating whatever RFI you end up with, as most cars will emit some level of RFI, some worse rthan others.....Good Luck & 73's, Paul KD5KCZ

Thanks to the respondants.

I put the scope on the rf signal. When modulated, the carrier does reduce some but the audio peaks go up as far and somewhat further than the carrier resting level. No sign of flattening out on the audio peaks.

Guess its working alright.

Why was the Yaesu tech so befuddled by the rf output meter activity if this is normal? Hmmmm...

# 11717. turn around time

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-22 05:18:10 UTC
From: TM
Topic: 11717  Message: 11717

Hello all DE N8NET.
Currently a friend of mine has his radio in the shop since (recieved by Yaseu) Dec 20th. I bought my two units two weeks after he did while I was evaulting my decision to the make and model I was looking for. His last contact was monday Jan 21st and they still have not assigned his radio to a tech.
Yaseu finally admitted on his last contact (Talked with a Manager) that his radio could be another month. Right after Christmas they had a flood of warranty work come in, like in the neihborhood of 3,000+ radios. I am going to send one of my two radios in when he gets his back. Right now he is borrowing my second radio and I had planned to rotate my spare til I got all the warranty problems resolved. Yes brand new and out of the box by atleast two weeks and I was getting both High SWR and and Heating issues. I like the radio alot, but guess I will have to wait for my babies turned to get fixed.
Just thought you all might like to know the reason for delays at repair center was.

Tim N8NET

Glen,
Well here is the whole problem on your Audio settings and that is the setting on FUNCTION MENU 27. DO NOT use the PRO. It causes the FT 100(D) to sound like there is a clothes pin over the operators nose and generally sounds like CRAP on the FT 100. The end result is that it splatters in a big way. For the extra little wattage you might get out of the FT 100 using the PRO NO ONE on the other end of the radio signal will be able to tell the difference between 100 watts and 102 watts, but they will be able to hear everything that is in the background including the road noise if you are mobile. If you want that extra punch adjust the MIC EQ and leave the PRO alone. I have come to this conclusion by NOT using bench equipment but the Real World as my testing grounds. You will never get any rig to

sound great to everybody you talk too but you can get a general idea to what sounds the best to the most people, you cannot do that on a test bench.

Mic setting will also vary from age group to age group you speak to as well. I call several nets and in the case of the 2 HF nets I call the age groups vary a tremendous amount. On the 75 mtr net the average age is around 60+ this great bunch of guys (The Early Bird Transcontinental Net) prefer one EQ setting on the Heil Pro Set 5 I use to call that net MIC EQ at #1 due to the loss of the hearing at the higher freqs and the Gain set at 75%, but they like the stock mic the best with the EQ off and the MIC GAIN set st 50%. For the 10 mtr net I call the guys like the EQ set at 3 and the mic gain at 50% on the Heil and again the stock mic is the prefered mic but with the gain at 75% and the EQ off. This group averages closer to around my age (37)and they HATE the PRO in both groups almost to the letter no matter the setting. Again this was using REAL WORLD conditions not using test equipment. Overall the Audio reports have been very good on my 100 with the stock mic and factory stock settings on my 9I serial # FT 100. Did I just get lucky or do I have a bunch of tone deaf locals and net listeners? I don't think it is either of those but ya never know do you. This has been another Soap Box speech brought to you by Sandor KG4FET's FT 100(D) Soap Box Tirades INC.

Hello,

I just hooked my new Heil Pro Headset up my FT100 using the AD-
100 cable.
But now I cannot switch the FT100 on.
When I remove the cable all is OK , even with no mike connected,
but as soon as the AD-100 is plugged into the mike input plug, the
FT-100 cannot be switched on.
On the package from the AD-100 cable is a sticker telling me that I
have to use an AD-1-Y or CC-1-Y cable.
I thought this was only ment for people who did not want to cut off
the mike plug and solder a normal mike plug instead to fit the
transceiver input mike plug ( I am also using a JST 145)
themselves.

So here is my question:

What does the AD-1-Y od CC-1-Y cable do?

Has it something to do with turning the power from the FT-100.
And if so can this be done inside the adapter plug?

A little help would be appriciated as I like to use the headset during
the PACC-contest the second weekend in February.

And when the comparators sense the final 'safe' voltage window, they
actively force the bridge driver chip to short the motor, for dynamic
braking. The idea is to eliminate uncontrolled coasting past the 'tuned'
point.
From all appearances, the autotune algorithm is made up of just a few simple
rules. Basically it runs the motor 'til it finds the first occurrence of an
'acceptable' swr (not best swr) and puts on the brakes.
It woks pretty good.

Sandor,
Very nice description of your audio reports.

The audio gain sounds extremely high to me. I thought
I read on here to keep it around 17 on AM and probably
about 30 or so on SSB. I get good reports with the
stock mic with these settings.

BTW, were your findings based on AM or SSB?

Date: 2002-01-22 20:15:33 UTC
From: lhlousek
Topic: 11724  Message: 11724

I've been signed up on this list for just a little over week now and thought I'd mention that I just ordered an FT100D and ATAS100. Serial number is 1I. I'll check it for SWR and thermal mods and report back. Thanks to everyone who provided me input on the decision.

Lou W7DZN

# 11725. Good AM operation with the FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)

From: backhoefade
Topic: 11699  Message: 11725

Look at posting 10277 for the basic AM settings.
Posting 8674 gives a hint on how to get a bit more peak power in AM.
Let me know how it works out.

# 11726. Re: The TWO BIG Chronic FT-100 Problems...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-22 21:39:41 UTC
From: backhoefade
Topic: 11696  Message: 11726

The spurious oscillation problem when operating on 24 MHz and 28 MHz is unrelated to the VHF/UHF cooling fan issue. Don't try to convince yourself that just because the spurious osc modification is in there that the lack of VHF/UHF receive fan activity isn't a long term problem. You will find that when you receive for long periods on 145 MHz for example that the rig will get too hot. The problem is real, especially in a warm ambient.

I recommend that you have the fan mod done by Cerritos. As an alternate you could implement the resistor mod that a lot of people have done successfully on this website. It just makes the fan turn all the time at slow speed, except when you transmit, when it will override the resistor and crank up the fan speed more.

The spurious osc fix is only correct if it's done with solid metal strips and screws that dig directly into the metal rib that runs across the center of the chassis. The sticky-back tape approach that they have used in the past will become ineffective over time as the adhesive loses its contact.

I had both mods done by Cerritos and my FT-100D has performed perfectly ever since. Overall the rig is only about 13 months old. The mods were done about 9 months ago. Only complaint here is the fan noise and I can't see any way around it. Tried changing to some fans with a much lower noise rating but it turned out the bulk of the "fan noise" is due to the air movement through the chassis, rather than blade cavitation noise, bearing noise or other intrinsic mechanical sources. One suggestion is to use the separation kit and place the rig off the operating desk. But it's really not that bad. For weak DX sigs I throw on the phones anyway!

Now that most of us have dragged ourselves through the undergraduate learning experience of the FT-100D I wonder what lies beyond.
I wonder what else Yaesu could do beyond an FT-100D with quiet fans, alphanumeric labeled externally programmable memory, IF DSP and perhaps DSP tailorable audio, programmable controls for custom access to your favorite features such as noise blanker, etc. How about something like a miniature FT-1000MP?

# 11733. A new SWR problem?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-23 03:59:14 UTC
From: John McClain
Topic: 11733  Message: 11733

Folks, I need help! My first FT-100 had a bad case of SWR on the upper HF bands and now I am having problems with its replacement. I have already mentioned that I am getting bad reports on my audio on FM and we have discussed it but it is still unresolved. I noticed that this particular rig was also displaying the SWR icon most of the time during a TUN operation but I didn't investigate it until this evening. I haven't seen this scenario mentioned here before so it may be a new symptom but, then again, it may be normal operation for all I know. What I see is a SWR icon everytime I press the TUN button if I have changed frequencies enough to cause a hi SWR at the beginning of the TUN. If I have only moved a few khz, everything is great, no SWR icon but if I have moved maybe 50khz to 100khz or changed bands, the rig will see a hi SWR at the beginning of the tuning operation and the

High SWR Warning (1)

SWR icon will be displayed. When the SWR drops to an acceptable level, the icon will disappear except for the letters 'SWR' and they will remain their until a second or two after the tuning operation is complete. The actual tuning is performed OK with a low reflected power indicated on the meter. This happens on all bands, in my truck with the ATAS-100 antenna and in the house on the FC-20 tuner with a beam and with a vertical. So, what am I seeing? Is this normal? What do the rest of you see on the screen when performing a TUN operation after changing frequencies 50khz to 100khz or even changing bands?

# 11737. F Menu Explanations

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-23 06:36:32 UTC
From: jrmorris28
Topic: 11737  Message: 11737

In the Yaesu manual, there are short descriptions for each standard function 01-66. Obviously, since the F Menu is not supposed to be accessed, there are none.
Could the folks "in the know" put some meaning into what some of these F Menu functions address? In particular, what are you setting in the following:

F11-F12: HF/V/UHF IC ALC

F13-F14-F15: HF PO 10W, 50W and 100W

F25-F36: TX IF G for each band. What does this actually do?

F37: ALC Meter How do you calibrate this? Is it necessary?

F38-F41: HF/50/144/430 PO Meter What do the settings represent?

F42-F46: HF/50/70/144/430 REV ALC

Don't want to be wasting bandwidth but "Inquiring minds want to know" :-)

Maybe all this is addressed in the service manual...

Thanks

John WB0RLD

Please see post 10541 under the large paragraph labeled "FEEDING"
I do not know if this is your problem, but for less than $.50 and 10 minutes time it is worth a try. It sure fixed my problem with the ATAS-100 and an unexplained SWR Icon.

I assume you have the Yeasu SWR mod installed by the Yeasu service department. If not, then there are literally 100 postings here and some pictures if you want to mod it yourself, You can also send it in to Yeasu for the mod.

From: n9cv
Topic: 11729  Message: 11739

I use the standard mount that you would use for a HAMSTICK. It has an insulated bolt on one side (I forget the thread size) and an SO-239 on the other. I inverted it and put the SO-239 up to screw on the ATAS-100, and I attached the coax on the bottom with spade lugs. I covered the spade lug connection with a distributor cap spark plug wire rubber boot. This unit is then mounted through a 1/8 piece of aluminum. It has lasted for 20,000 miles so far and it is weather tight to preven corrosion to the connections. The road salt has not bothered it yet. I also made a carwash cap out of the collar part of a PL-259 with a plastic plug in one end from Sears Hardware.

# 11743. RE: [FT100] F Menu Explanations

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-23 13:44:19 UTC
From: agzol@tm.net.my
Topic: 11737  Message: 11743

Hi John, This is my understanding of the F Menu. The FT 100 is CPU driven transceiver ( 3 in totals). The whole system relies on the proper functions of these CPUs. If you have access to the service manual, there are not much pot and trimmers which we can tweaks. There are various DACs and ADCs in the whole system. These are the devices which connect the real world to the transceiver. We give the inputs, and these devices tell the CPUs what to do. An example, look at Menu 23 on your FT 100. It's the VHF Power output, and it is only numbers ( 1 to 100). The VHF output is about 50W ( as the book says) and that 100 units is suppose to give you 50Watts. So what is next?? Due to variations is the components, these values are not the same from one rig to another, so some sort of calibrations has to be done in the factory to set the standards. Look at you F Menu ( hidden menu ) items F21 and F22. These are the values when they calibrated the rigs before they were shipped from the factories. In my case, my F22 is 105 and Yaesu Global value is at 110. My F23 is at135, and Yaesu Global values is at 152. These are the values when the rig is calibrated for 20W and 50W output. Your values could be different mine, due to the components variations. The rest of the menus are of similar in nature, and I hope you copy your F Menu values and keep them safe. In case something went wrong, all you have to do is put back the values in the proper menu. If you think of changing these values, pls. think twice, unless you have access to the service manual and with the proper equipments for calibrations. The Function menus were accessible to us to do the changes within the limits of these hidden F menus. I hope this will give you a better understanding of the hidden menus, and I stand to be corrected if these explainations are wrong. Thank You 73s de Zool 9W2AC / Malaysia > ** Original Subject: RE: [FT100] F Menu Explanations > ** Original Sender: jrmorris28 > ** Original Date: Wed, 23 Jan 2002 18:57:37 +0800 (SGT) > ** Original Message follows... > > > > > > In the Yaesu manual, there are short descriptions for each standard

From: Jeff kb2m
Topic: 11729  Message: 11744

I plan on fabricating some kind of mount for the ATAS I just ordered but what do you guys use for the base.

I use a RS 940-0913 , mounted to my roof rack and grounded, drilled out to accept a PL 258 jack to jack adapter, the adapter is passed through the drilled out mount , and tighened to the antenna with a nut, tightened gently with a wrench. A standard adapter is long enough , to allow plenty of thread for the coax 259 to connect to. When I leave the vehicle at the airport , or remove the antenna for any reason I place a plastic dust/water cap on the antenna side of the mount, to keep everything in place. This work's well centered on the roof. The antenna isn't very long, so I haven't experienced any clearance problems, with this mounted on the roof of my Exploder...

Ken,

Good bit of detective work on your SWR problem and the spring in the SO-239 connector is a great idea. I imagine intermittent contact while transmitting could easily lead to blown finals.

Part of the problem may be due to varying quality of SO-239 connectors. The base metal of the center conductor receptacle should be springy enough to maintain good contact. Cheap connectors may have soft metal and the leaves of the receptacle stay spread apart rather than grip the center pin. Either way it'd be hard to know for sure whether good contact was being maintained so the spring is a good idea.

==========
Regarding varying quality of SO-239 connectors. The problem has taken a bite out of commercial transmitter folks on occasion. The usual problem is that some connectors use phosphor bronze for the spring material, not beryllium bronze. Especially with temperature swings the phosphor bronze will take a "set", and contact pressure will be insufficient for good electrical contact. I saw a large production run of cellular mobile telephones that had to be field "fixed" for the problem. But that was not half as serious as having the problem appear back in WW-2 with the "jack-bars" on the BC-375/191 when there was a shortage of the beryllium bronze and phosphor bronze was substituted. This is hardly a new problem.

No, I don't know how to tell the difference in spring material when holding a connector in my hand. Catalog numbers won't tell you, and even production runs might be one or the other, which is what caught the cellular phone folks mentioned above.

Good bronze and bad bronze. I do not know how to tell them apart, this is exactly what was happening to me. I could squeeze the connector back together and after two or three removals the problem was back. I even tried a different manufacturer of the connector and had the same same problem. I must have bad bronze in my connectors.

Anyway I do not know if this is the problem you are experiencing, but the fix worked for me. I do make sure there is a car wash cap on the connector when the antenna is removed at the car wash. This way I do not loose the little spring from the jet spray against the connector when the antenna is removed.

# 11753. A new SWR problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 01:26:58 UTC
From: John McClain
Topic: 11745  Message: 11753

I haven't seen a reply yet concerning my current SWR problem on a modified FT-100. If I change bands and then perform a TUN operation or if I move from one end of a band to the other and then perform a TUN operation, I see the SWR icon (an antenna, a big X, and the letters 'SWR') while the antenna is tuning. Still during the TUN operation as the antenna nears resonance, the antenna and X in the icon are replaced by the animated arrow going up and down but the letters 'SWR' remain. A second or two after the TUN operation is complete with low reflected power indicated in the meter, the letters 'SWR' disappear. Does anyone else see this? I really need to know what the rest of you see because this will determine whether or not I return the rig and get an IC-706. I am sorry but I am becoming very frustrated.

# 11754. New FT100D and ATAS100/ mounts

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 01:02:04 UTC
From: lhlousek
Topic: 11754  Message: 11754

Just received the new FT100D and ATAS that I ordered yesterday. Serial number is 1I (July 2001) and it has the SWR mod but no obvious thermal mod (no thermal switched installed per the photos in this group's files).

Although I had seen ATASs before it is amazing (appalling?) how small it is. It's going to be embarrassing pulling into a hamfest with such a puny, impotent looking, HF antenna. Sorta like going to the showers after a cold swim.

I'd like to thank all those who gave me suggestions as to mounting options and bases...lots of good clever ideas. I am going fabricate my own mounting bracket and use a Comet cable assy for the base. Before I actually had the antenna in my hands I was thinking a lot beefier than I am now. Looks like this thing will put less load on a mount than a HamStick.

Lou W7DZN

When I tune my ATAS, I see an SWR with an X near it
just momentarily (about 1/4 second) and then I see the
animation icon while it's moving. Incidentally, I
never noticed it before, but thanks to Jeff's comments
I can now see that the animation is slightly different
when the antenna is retracting vs. when it's
extending. Then when it achieves a low SWR, the SWR
and antenna icon comes on for about 1/2 second with an
'O' near the antenna. The SWR icon does not appear
while the animation icon is present.

Ya know, I have the opposite experience. I would like other's comments.

Universally, whenever anyone sees my vehicle and comments, they all say
"that's quite a large antenna you have there... who do you talk to, Mars?"
and things like that.

Personally I don't think it is so big, but everyone else thinks it's a
monster.

> I once read an ad about a remote control box that would allow the manual operation of the ATAS 100 antenna so that it could be used on other radios such as the IC-706 but I can't find the ad. Could someone aim me in the right direction?

You could spend almost $100 on it.

You COULD build it for well under $20

1 small aluminum box
2 SO-239 chassis sockets
1 7808 8v regulator
1 100uH choke ( to isolate RF from DC )
few .01uF bypass capacitors ( to short crud to ground at the regulator )
1 .1uF capacitor ( to isolate DC from the radio )
1 S/DPDT center off momentary switch ( to select regulator output or raw 12v to go through the coil to the antenna )
various wire and coax
optional LED to indicate action and direction

The switch momentarily provides EITHER 8v or pure 12v to the antenna-connected SO-239 VIA the 100uH choke.

The .1uF cap COUPLES the radio and antenna sockets together, as short a path as possible.

The .01uF bypass caps go to the input and output pins on the regulator to gnd.

```
rig>>-----||----p----->>ant
|
o-0)))))--/
|
/\
```

8 or 12v switched to coil momentary.

ALL parts at Radio Shack. Works great, lasts long time. I use it with my FT-817

Thanks

Topic: 11737  Message: 11760

Thanks Chas and Zool. I had adjusted about a dozen or so F menu items to a rough average of the Yaesu Global settings and other's settings. Some were quite a bit different than my original readings....BUT I did write the old ones down. I've set them all back now. I am the 3rd owner of this FT-100 and can only hope no one "adjusted" them prior to me getting it. Thanks for the explanations. I'll keep my mitts off ... except F51 which I've set to 25 watts idle carrier. Which, on my radio, is about 62. From: John Spiceman
Topic: 11729  Message: 11761

Yes. Although it worked fine without one.

The way I do that is to take a dual female extra long coupler with a couple of nuts in the middle. You can get a special ring that will fit on this dual female connector between the two nuts and it has a soldering lug on it.

I simply soldered a piece of ground strap from that to a lag screw into the frame.

Then I put the ant coax into one end and tie it up under the back seat speaker deck. Then I go from there to the FT-100 with another piece of coax.

Seems to work pretty well except on 17 mtrs. I think if I mess with the feedline length I can make that work.

# 11762. Re: [FT100] A new SWR problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 05:16:06 UTC
From: robert blumenkranz
Topic: 11745  Message: 11762

After it stops does the SWR indicator come on when you
key up or does the rig work correctly after that.
If the SWR indicator stays on for a second and then
when you key up you see it again, you may have the
problem I had. Look at your antenna carefully when you
do a manual UP command and release the button does the
antenna stop dead or does it reverese direction a bit?

Thanks,
Bob Ni6r

It is functionality and how you use it, not size that counts.

My Signup welcome said dont be a lurker, so Here goes.

I do not have a FT100, I currently have an Icom 735. But its OLD and tired. Ive been looking at both the 706MKIIG and the FT100D. I just bought the FT1500 2 meter and am really impressed with it. So Im leaning on the FT100D.

SO, I joined the list to get Ideas of how it works and the general consensus of owner enjoyment.

Please dont reply how much you do, I can look at back messages for that, plus we dont want to clutter the list. Ill just read the list for a while to get that flavor, as I have plenty of time for the funds currently arnt avail yet. But, getting there.

Now I can lurk.

Rick KF7QZ
Everett, Washington.

From: w3wjr@aol.com
Topic: 11745  Message: 11765

you know this sounds like what my FT-100 does. I see this every time I tune mine (manual antenna tuner). I start out the match is like 5:1, bring the match down to 1.5:1 or so but the SWR light takes a couple seconds to go out. compaired to what it did before the mod, I don't think this is a problem. Almost acts like the logic that turns on the SWR light is heat, and even thought the match is now correct it takes a second or 2 for what ever "logic" turns on the light to catch up with the match.

When they see my car with the 60 inch dual band antenna on the roof, a cell antenna, two hamsticks and the regular broadcast antenna, sometimes they ask if I talk to "Outer Space." They laugh hysterically when I tell them I have talked to the space station!

<<You COULD build it for well under $20>>

As I understand it, the FT100 puts out 8.4<V<10 for about a 1/2 second after a move which causes the circuit in the antenna to short the motor leads and provide braking. I wonder of the commercially available control box does that. It might be a nice embellishment to your home brew control box. Then again, it might not be necessary.

# 11770. Microphone pin out

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 14:34:18 UTC
From: Bob Evans
Topic: 11770  Message: 11770

Hi everyone,

I've managed to lose my manual and need to know the pinouts on the RJ-11 microphone connector. Actually, just the audio pair are the ones I need. Anybody got a manual handy?

By the way, just to balance things out here, my FT100 is still working perfectly after 18 months and its never (knock on wood) been to the factory for repairs/mods. I'm taking it to ZF (Cayman Islands) for the ARRL DX CW contest to give it another contest workout. ATAS-100 still flawless as well.

Thanks!
Bob Evans, K5WA

That's been my experience with the public as well. It is a good chance to
do a bit of a sales pitch on ham radio though.
At ham fests, I get lots of inquiries about it, and they have always been
inquiries of interest rather than negative comments.

I would also like to see a short description of each item in the "F" menu. Although most of the settings are set at the factory and shouldn't be changed, there are probably several that we could tweak based on our own unique installations that would better serve us. Is this information explained in the service manual?

Thanks,
Mike KI5MP

# 11774. New FT100D, first impressions.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 16:15:04 UTC
From: lhlousek
Topic: 11774  Message: 11774

I read through the salient sections of the manual, hooked up my new FT100D in the shack, and tried it out (on CW).

These are my first impressions. Please let me know if there are easier ways to do things or if I'm wrong about anything.

I didn't do any critcal listening tests or RX comparisons but the RX sounded good. With phones plugged directly into the speaker output the side tone was horrendously loud and I could hear hiss and digital hash. A 150 ohm resistor in series with the 36 ohm head phones (18 ohms with L and R connected in parallel) (a little different than what is shown in the manual) brought the side tone in line with the received audio and made the hiss and hash inaudible. The manual says the rig is too small for a headphone jack. Give me a break. I could add one but it'll probably make more sense to put together an external box with headphone and speaker jacks and a switch to switch between the two... and maybe a separate volume control for the phones to make it easier to control the relative level of the side tone.

Fans were initially off but cycled on and off on low speed after the rig warmed up. If the fans were running on low speed, switching to VHF made them stop and going back down to HF made them start again. I think I will probably do the resistor to ground mod on the fans when it gets towards summer.

Power output was a little stingy ranging from 80 W on 160 m to 95 W on 40 thru 20 m and 90 W up thru 6m. I guess this is about par for these rigs? I measured 40 W on 2 m but don't have any sense for how accurate my power meter is on 2 meters. On HF my power meter agrees very closely with the power meter on my MkV and a few other meters and rigs that I've tried. Not that 1/2 a dB here or there is going to make any difference but it would be nice if these rigs met spec.

First QSO was with SP9FV on 20 meters with 40 W CW. The only way I could figure out to get a spot tone for zero beating is to switch off BK and hold the key down. Seems too easy to accidentally transmit on top of a station your trying to tune to. Is there another way?

For operating CW I had Func set on line 8 so I could turn BK on and off to get a spot tone (also good because it has the memory keyer buttons) and the menu set to 52 so I could reasonably quickly access the keyer speed. Unfortunately, to work split, change filters or change IPO/ATN/AGC/NB settings you need to scroll though all 9 Func lines. Changing DSP DPB width or output power will mean scrolling through a bunch of menu items to get back to keyer speed. Lots of button pressing and knob twirling. The user interface is linear and logical but not easy or convenient to use. Given the number of buttons and knobs I think they could have come up with a much better system.

QSK was pretty good but the relay sure is loud. I guess in a mobile environment with the main portion of the rig mounted out of the way it won't be an issue. There were some QSK clicks in the audio with the 500 Hz filter but not the 2400 Hz filter. Similar to my MkV in this regard. Does anybody have the 300 Hz filter installed?

The first 40 out of the 60 dimmer levels for the display don't do anything. The remaining 20 levels work fine but makes you wonder why the first 40 are there.

I'll be using the rig in my shack for a few days before installing it in my 97 Explorer along with the ATAS this weekend. If I get a chance I might try out the ATAS with a few counterpoises before installing it.

I am thinking it is unnecessary. I have never noticed the coasting down effect. And I just watch the internal SWR indicator on the FT817, when it dips I let go and it works great.

Here's how I set up my sidetone level for both headphones and speaker.

Open up the top of the chassis (6 screws) and carefully adjust VR1004 (I think that's the number) which is the surface mount pot next to the connector on the PC board for the speaker wire. Set it for whatever level you want for sidetone out of the speaker. Of course you need to place the top back on the rig for a final audio level check. Then go to radio shack or similar and buy some inexpensive headphones that have an in-line volume control. Also buy the "stereo to mono" adaptor at RS if the phones are stereo. I bought some phones called something like "Titanium" that were normally $40 but on sale for $20. An added benefit is their fidelity when you run AM on 80 meters or do casual listening, albeit mono, on the commercial FM band. Then you can use the in-line volume control to set the sidetone level in the phones. You'll see what I mean when you do this. The nice thing is that once you have set the in-line control for the desired side-tone level in the phones, then you can use the volume control on the front of the rig to adjust the signal volume, but the side-tone remains just where you wanted it. Perfect!

You can use the "sub menu F functions" to set your output power on HF to a solid 100 Watts out if you want the full 100 Watts. You can even run the thing up to about 160 to 170 Watts out CW if you want but of course don't do that. Hold buttons A,B and C in while turning on the rig. Then go to the scrolling menu and scroll past the last standard function to get to the "F" functions. Then find the F functions that's called "HF 100W" (or similar to that). Then key down with the keyer disabled and set the output to 100 Watts. I think the function is either F15 or F21 but I'm not certain. I don't have the rig with me right now. Be sure you use a good dummy load and accurate external power meter when you do this. You can do the same thing for 6 meters, 2 meters and 70 cm but, again, you must have a dummy load and power meter rated for those frequencies and power levels. I would just set the HF output power and leave the others alone myself. If you want to know how to run AM with the FT-100D read my post about it. You can find it by entering "F51" in the search window of this website and then finding the post called "AM operation with the FT-100D". Have fun!

Why, is the side tone fixed? It doesn't track with volume? I hadn't noticed.

Subject: [FT100] Microphone pin out

Hi everyone,

I've managed to lose my manual and need to know the pinouts on the RJ-11
microphone connector. Actually, just the audio pair are the ones I need.
Anybody got a manual handy?

By the way, just to balance things out here, my FT100 is still working
perfectly after 18 months and its never (knock on wood) been to the factory
for repairs/mods. I'm taking it to ZF (Cayman Islands) for the ARRL DX CW
contest to give it another contest workout. ATAS-100 still flawless as
well.

Thanks!
Bob Evans, K5WA

It's hidden in the manual, but they prefer you tune the antenna at 5 or 10w before bringing the rig up to full power. For $70, there really is only $5 of parts in it. For $20, you could build one with much higher voltage parts (I used 3KV caps and a 1A choke).

Just my 2c

# 11782. ATAS first impressions

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 18:37:17 UTC
From: lhlousek
Topic: 11782  Message: 11782

I couldn't wait so I rigged up my ATAS with some counterpoises, a choke balun on the feedline, and tried it out. It works properly as far as I can tell (runs up and down, finds a tune and doesn't overshoot). I tried manual tuning too. It couldn't find a tune on all bands but that's not too surprising considering my counterpoise set up. Heard pleanty of sigs a IDed after the tune but did not attempt any QSOs with the antenna sitting in my shack. FB so far.

I haven't measured it but according to the display on the rig the power is reduced to something under 10W while tuning.

I noted the admonition in the ATAS instruction sheet to not attempt tuning while driving. Is this a real limitation of the antenna or just the typical CYA boilerplate absolving Yaesu of liability should you crash while dorking with the antenna?

Correct - it does not track with the volume. That's why the in-line volume control approach works so well. You set it to the level you want in the phones (of course after first setting up the internal pot for the speaker level) and then you can crank the volume to high-heck on weak signals but still not blow your ears out with the side-tone.

Chas,

Your suggestion to use a headset with a built in volume control is a good idea. Similar to my idea to include a volume control for the headset in a audio breakout box. Might be easier to get a head set with vol control specifically for the mobile.

Also understand about the hidden menu items for setting max power. Perhaps when I get my hands on a calibrated Bird I might adjust them.

Thanks for the info.

# 11785. Found a bug in the keyer!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-24 19:52:34 UTC
From: lhlousek
Topic: 11785  Message: 11785

I found a bug in the memory keyer. It's similar to a known bug in the MkV.

I like a slightly heavier CW weighting than textbook standard so I set the keyer dit weight for 13 and dah weight for 36. (the increase in the dash length should be twice the increase in the dit length to keep the timing correct). An explanation: The textbook weighting is a dit and a space are the same length and each is three times longer than a dah. Two dits and two spaces fit in the same time as a dah and one space. That means that dits occur twice as fast dahs. If you're rhythmically inclined you can hold the dit lever or dah lever while tapping your foot and verify this ( sixteenth notes vs. eighth notes etc.). Anyway, to keep the correct relative timing increase the dah length twice the increase of the dit length.

Oh yeah, the bug.....The first time you use the memory keyer after turning the rig on the weighting will revert to 10 and 30 but the displayed values in the menu will still be 13 and 36. If I change the displayed values away and then back to 13 and 36 the weighting is correct from then on until the next time I power up and use the memory keyer. The MkV has the same bug but only the dash weight is affected.

Subject: Re: [FT100] A new SWR problem

After it stops does the SWR indicator come on when you
key up or does the rig work correctly after that.
If the SWR indicator stays on for a second and then
when you key up you see it again, you may have the
problem I had. Look at your antenna carefully when you
do a manual UP command and release the button does the
antenna stop dead or does it reverese direction a bit?

Thanks,
Bob Ni6r

Lou,

I have found the the admonition is mainly a CYA statement. I tune mine regularly at speeds of 70-80 mph. Only 15 meters has occassional problems tuning at high speeds, all others are nailed perfectly. I think you'll be absolutely amazed at the performance of this little antenna. I have consistantly beaten Hamsticks, Outbackers on 20M-10M and even tied a 16' tall, truck mounted, Texas Bugcatcher with a top hat on 40M SSB. It seems to be quieter than other antennas, for some reason and I can hear great. My most exciting QSOs were working Russians on 40CW during the CQWW DX contest, all while driving, of course. You just don't expect that little antenna and 100W to perform that well. I've had it for 18 months and still amazed every day with it.

Subject: ATAS first impressions

I couldn't wait so I rigged up my ATAS with some counterpoises, a choke balun on
the feedline, and tried it out. It works properly as far as I can tell (runs up
and down, finds a tune and doesn't overshoot). I tried manual tuning too. It
couldn't find a tune on all bands but that's not too surprising considering my
counterpoise set up. Heard pleanty of sigs a IDed after the tune but did not
attempt any QSOs with the antenna sitting in my shack. FB so far.

I haven't measured it but according to the display on the rig the power is reduced to something under 10W while tuning.

I noted the admonition in the ATAS instruction sheet to not attempt tuning while
driving. Is this a real limitation of the antenna or just the typical CYA boilerplate absolving Yaesu of liability should you crash while dorking with the
antenna?

Try www.powerwerx.com
They have the exact plug. I bought a couple from them last year.
Perfect match, all you have to do is add wire.

Just one more accolade for the ATAS100.

Just late yesterday afternoon, I talked to Vlad, UA0FAU, for about half an hour. 5-9 signal report as I was traveling to an appointment on I-405 near Seattle. The chap he was talking to prior to me was also in his car and traveling around Seattle. He got a 5-6/5-7 and was using a ... I dare say IC706 and a screwdriver ant.

I get consistantly good reports, on AM as well. So far its a great antenna and performs beyond my expectations with only an MFJ mag mount on the back trunk lid.

I tend to work the higher bands in the car since they are "open" during the day, which is when I'm in the car.

# 11797. Outbacker Antenna

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-25 16:55:35 UTC
From: Page Pyne WA3EOP
Topic: 11797  Message: 11797

I saw in yesterday's mail an ad for an Outbacker Perth Plus.

The price is good if that is what you want.

I have tried several antenna systems with my Ford Festiva Pocket Rocket Mobile including the Perth Plus and here are my brief observations:

Hustler Tri-Band Mobile on 20, 40 and 75. - Works good on 20 and fair on 40, so so on 75. Antenna requires a Husky Mount - Forget the Three Magnet Mount, it isn't up to the task.

Ham Sticks for various bands. These work to a fashion and don't require a husky mount. It will get you by if you want to operate one band primarily or want to start out Low Budget.

Outbacker Perth Plus. Small convenient mounting at only 6' length. Works great on 20, 17, 15, 12 and 10. Didn't try it on 6 or 2 meters. Does work on 40 somewhat and 75 is somewhat hopeful thinking.

Outbacker Outrunner - this is the 9' model and so far I like it. Best of the Bunch by far on 75 and 40 meters. Have worked coast to coast on 40 several times, coast to coast on 75 very occasionally and into Midwest on 75 from the east regularly. 20 and 17 are good, in fact 17 is surprisingly good. 15 and 10 work ok too.

All antennas were side mounted to a ball mount about 1 3/4' off the ground.

Maybe that will help anyone considering these antennas. Bear in mind the Ford Festiva is a Mini-car and doesn't offer a lot of surface metal as a counterpoise on the low frequency H.F. Bands. The Outrunner allegedly does 160 but I haven't tried that... yet.

Is there a way to manually adjust the ATAS without transmitting? I tried a number of things and it doesn't seem to be possible. I want to be able to do to peak up on a received signals or noise either inside or outside of the amateur bands. Outside the amateur bands it won't move at all (I have not enabled general coverage transmit).

What mount do you use? I'm hoping I can use a trunk lip mount type
such as the K-400C (think that's what it's called) on my Prelude.

The only way to do this, without enabling emergency-mode general TX, is to interpolate where you want to be. For example, if you want to monitor Air Force Net on 11.175USB ( interesting ) and have the length optimized, go to a valid 30m freq. auto-tune normally, and press PTT and the front-panel DN button, and then watch the antenna retract to approximately where you guess it should be between 30 and 20m.

I received my FT-100D today from the Yaesu people after they repaired (under warranty) the standard SWR, heating and garbled RX audio problems. Turn around time in total was 5 weeks. The invoice returned with the unit had a "declared value" of $1,699.00. I assume this was their internal cost for repair. A person could buy two new FT-100's for that sum.

In addition to the standard mods discussed in this group, they also replaced two rotary encoders, an IC, did "AM REPAIRS" and a total realignment. I just got through trying to test the unit and it will intermittently transmits every 2 seconds, by itself, with the microphone attached. This problem ceases when the mic is detached. The mic worked fine at the time I sent the unit to Cerritos.

I can't imagine what I might be doing wrong and must assume the Yaesu let this out of their shop without a thorough test. I have listened for the most part to the comments in this group and have been amazed at the Yaesu group giving the ham community the quality of product and service I have heard about and am now experiencing. I don't want to rush to judgement on Yaesu products, but so far the "sailing" had been through rough seas.

I am going to try a substitute mic tomorrow and see if that makes a difference. Other than that, I am at a loss for ideas. Anyone out there have suggestions.....Disillusioned in Oklahoma, Paul KD5KCZ

You have to get the filter, no way around it to get something resembling AM.

"Declared Value" is what they state as the value of the item to the shipper for insurance purposes. "AM Repair" (I'm quite certain) refers to Amateur Repair (as opposed to Commercial Land Mobile?). I've interpreted this to be their labor cost at the "Amateur Repair" rate. Any better information out here?

Hi everyone,

I've been hearing a lot about the ATAS-100 antenna.

Can someone enlighten me as to whether it is available in VK and if so,
about how much.

I have had a look at the DSE online catalogue but couldn't find it in there.

Every post that I have seen here says install the filter first, then try the recommended settings if you are not completely happy. I understand the AM filter is a prerequisite to AM operation
I do not personally have experience in this area as I have always had the AM filter and also I rarely even try AM.

The $1699 was probably their list price for a new radio for insurance purposes. Yes, you could buy two new ones for that price, but you would still have to send them in and wait another 5 weeks for each radio.

Have you checked to see if the VOX is on for your microphone problem?

# 11815. HF Audio problems

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-26 12:32:00 UTC
From: wb4tdb@aol.com
Topic: 11815  Message: 11815

I have very very low receive signal. I can hear back ground noise. I have tried
various antenna with no change. I have done the reset procedures. I still get
full power out on transmit. VHF and UHF work fine.

When I power up there is an icon in the upper left part of the display just above
VFO it show a two plugs going together with the "ON" just below. This Icon is
on only for less than a second.

Any help appreciated.

# 11818. RE: [FT100] Re: am transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-26 14:47:59 UTC
From: Tom Tishken KD4WOV
Topic: 11805  Message: 11818

The AM filter is needed because with out the am filter, the AM mode uses the SSB filter which is 2.4 KHz and less than half of the band width of the 6 KHz AM filter. This is why the audio is poor. Effectively your audio is limited to 1.2 KHz as compared to 3 KHz audio of a Normal Am signal. You can get away with 4 KHz AM filter but it still limits your audio. Remember AM uses double SSB with a carrier inserted (I know, but it is a very simplified example), therefore to get the same audio quality you need twice the bandwidth.

Hope that helps

Thanks for confirming my suspicions.

If the antenna could be moved without transmitting it would be possible to tune up on noise or sigs when listening out side of ham bands or get close to a tune prior to transmitting when tuning in the ham bands. The way it is now there is no real way to tune the antenna outside the ham bands and you have to create QRM the entire time the antenna is moving from one end of its range to the other when in the ham bands. (Don't forget to ID after you tune!) I can't think of a reason why they don't let you move the antenna without transmitting and don't see how it would have cost them anything to permit it. Just another boneheaded Yaesu "feature" I guess.

The DC motor voltage and antenna signals are carried on the same conductors. If you were running a DC motor at the same time you were receiving a weak RF signal on the same conductors, it's unlikely you'd hear anything other than motor brush noise while moving the antenna. So the original need, i.e., being able to peak on a received signal, would be difficult with the ATAS or any screwdriver antenna for that matter.

Good point but not true in this case. I know guys who are using the ATAS100 with IC706s and the aftermarket control box and they can easily tune the antenna on received noise. The standard drill is to change bands with the radio, peak up received noise with the antenna to get close, and then do a final tweak to the tuning while transmitting.

Even if it were true, there is still benefit to being able to move the antenna without transmitting.

# 11823. IF shift vs Clarifier

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-26 17:01:07 UTC
From: lhlousek
Topic: 11823  Message: 11823

Trying to use both the Clar and IF Shift I see that I can tap the Clar button and adj the Clar, then press the button (>1/2 sec) and adj the Shift and Clar will maintain its setting. However, according to the manual (page 42) I should now be able to press (1/2 sec) the button and go back to Clar with Shift maintaining its setting. This doesn't happen. Shift is reset to zero. So, the only way to have both Clar and Shift engaged is to first set Clar and then Shift. If you want to tweak the Clar you will lose your shift and have to redo it.

This seems to be a case where they had the right idea (according to the manual) but the screwed up the implementation.

Have you done any changing of the "F Menu" settings?

I changed a bunch of mine to closer match the Yaesu Global settings. After a few days I sensed that the receiver audio, especially on AM, was weaker and a lot more distorted than I thought it had originally been. The receiver just wasn't as "hot" as it had been. Luckily I had copied down all of the original settings before I got my mitts in there.

Changing all values back to the original settings cleared everything up. The receiver again had that little extra...

Hi Eric, I suggest you telephone DSE and ask as it appears from what other VK's have said that DSE often have parts available that aren't in their on-line catalogue. The ATAS-100 is available here in ZL through the Yaesu agent, so I would be surprised if DSE don't have it available.

It's unfortunate that we don't have any local ham radio stores as they do in the USA though as it does make it harder to obtain these goodies. No AES or HRO or anything like them here in ZL. I think my closest ham radio store would be in Auckland. This is a 10 hour drive plus a 3 hour ferry across the Cook Strait separating the South Island from the North Island!!

Grant, ZL2BK.

# 11830. Re: [FT100] am transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-27 04:24:55 UTC
From: Bob Cheek
Topic: 11805  Message: 11830

Addition of the AM filter only affects the receiver, not the transmitted signal. The 2.4 SSB filter is a little too narrow for AM operation. You can set the filter to 6Khz on the menu and without a filter in the rig it will open it up to about 20-25 Khz bandwidth, whatever the IF stages are, and that is actually too wide for good operation on AM.

The bad audio reports are probably related to the carrier level settings and audio level settings not being set correctly. The factory defaults were not workable for my FT-100. I recall that I had to set the carrier level and the audio levels down. I used a scope to set the modulation envelope, but a close by station and some experimenting you can get them set. I would give you mine but the rig is in service department in California.....

The ATAS will move under control of the radio with the receiver ON so that you can hear the changes in the noise floor under certain conditions. For example when you first reset the radio and select the ATAS-2 after resetting the micro, it the antenna happens to be fully extended, the antenna will retract while the receiver is on. I have observed this. Under this condition the FT-100 is NOT sending any RF out so the the receiver is on during the motion. There is no way to stop the motion since this appears to be a reset timer command issued from the radio to make sure that the antenna is in the right position to begin using it. It should not be too dificult for Yaesu to make this type of movement available by allowing the antenna to move with no RF or without keying the PTT during manual operation. The only way I know of that you can do this on your own, is by applying the necessary UP/down voltages through an RF choke to the antenna while the receiver is active. As long as the radio is not sending DC at the same time this should work OK.
Thanks,
Bob Ni6r

# 11835. FT-100 w/atas100 REDUCED AGAIN

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-27 16:47:06 UTC
From: wolobmp
Topic: 11835  Message: 11835

For Sale: FT-100 w/ATAS100 Yeasu hf mobile with hf antenna. This is the non-d-model and has been too Yaesu for updates and any modifications. Had a buyer but backed out; so will REDUCE AGAIN too :$775 and I will ship! Comes with box,manual,mic,power cord, complete, in mint condition. Will not sperate and please no trades. Money order or cashiers check only, sorry no COD's. Email be at wolobmp@... or can give me a call daytime at 330-796-8092 and leave message.

# 11836. CW interface with WriteLog

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-27 14:45:51 UTC
From: bob frick
Topic: 11836  Message: 11836

For the group,
I have been using WriteLog software with my FT100 for
some time now. However, in the past I have always been
using my PK-232 for CW. Unfortunately, however, I did
not bring the PK-232 with me to Azerbijan so all I have is
my FT-100 and Laptop. I have my license to operate and
really want to get on the air in CW but am having probs building what should be a simple CW interface.

The diagram in WriteLog software has the following CW
keying schematic:
|
Pin 17 into 1K resistor then into a|/---------------- Stereo Key Jack
NPN2N2222 |\----
|
1-----------------------------------------|

18------------------------------------------------------ Stereo Key Jack

I was able to find the 2N2222
and the 1k resistor but I cannot get my rig to key.
So Ive a couple of questions:
On the 2N2222, which leg is the input, ground and output?
Ok the stereo key jack, do I use tip and ring, or tip and ground?

Again, all I am trying to do is key the rig via my computer and the WriteLog software.

Any simple, easy suggestions, answers, ideas would be greatly appreciated.
Keep them simple please, seems Ive destroyed a lot of brains cells lately.

From: n9cv
Topic: 555  Message: 11838

I spent about 1.5 hour last night trying to find who the Yaesu dealers are in both Australia and New Zealand. I found none. I had trouble with the Dick Smith (DSE) web site so DSE might me a dealer. I could not tell.

The Yeasu sites do not list any Australian dealers either. I checked the three Yaesu sites (US, UK, and Japan. They had no listings for Australia. If you move to South America I can give you dealers names, but not Australia.

I sent an email to all three Yaesu sites asking for Australian dealers. We'll see if any of them return my request. My track record with Yeasu (USA) returning emails has been 0%. Maybe my luck will be better and we will get an answer this time from one of the three sites.

Every Australian ham dealer I found on the web had Kenwood and Icom and some had Alinco, but no Yaesu.

Where did you buy the FT-100 you now have? Where do you send your Yeasu to for repair? Why can't you go to one of them for the ATAS-100?

A final thought, If you can not find the antenna you want in Australia, one of the ham dealers here would probably sell the item and export it. If not, then one of us can buy it and mail it to you. This might cause some difficulties for you in the future if you ever need reapirs. Also you may have to pay an Australian import duty if we mail it. They go for about $300 US new.

Good luck, Let us know if you find one or need more help. I will forward to you anything I receive from Yeasu.

Hey Paul, I recently experienced a similar problem with intermitten transmission. I ordered a new mike from HRO and continued to run the radio without the mike.(SWLer you know) then last week (HRO backordered my mike) I decided to check the old mike out again. Worked fine. The Yeasu gremlins fixed it on the fly I guess. I now have spare mike tho so I am ready if it happens again. I should mention, I carry my rig in an 18 wheeler so vibration and banging around are facts of life I have to deal with.

73s
jerry KB5VZC

I am going to try a substitute mic tomorrow and see if that makes a
difference. Other than that, I am at a loss for ideas. Anyone out
there have suggestions.....Disillusioned in Oklahoma, Paul KD5KCZ

# 11841. Home Built Screwdriver Antenna with FT100 Interface

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-27 04:09:16 UTC
From: m0cke
Topic: 11841  Message: 11841

Hi all,

Interested in a screwdriver antenna which will act the same as a ATAS on HF but give you 80m (And top band with aditional coil). Then look at my home page, I have built my own Screwdriver for around £50 and then I added a circuit to allow the FT100 to tune the screwdriver on 10 - 40M and you can manually tune it for operation on 80m

http://www.j1mbo.f9.co.uk/m0cke.htm

I hope you find it of interest...the Antenna is about 3 years old and the FT100 & interface is 2 years old.

Regards,

Jim M0CKE

Hi Ken,

Thanks for the effort you put in.

The Australian dealer for Yaesu is Dick Smith Electronics and it is them where I purchased the FT-100D.

We have a major field day coming up in about 3 weeks time and I will approach them there as well as writing to them.

I did receive a reply from another VK who has already been down that path without success. they gave him some lame excuse about type approval which, I believe, does not apply to this case anyhow. You never know, maybe a bit of pushing will help. We can but try.

I have seen them advertised for around US$320 on a couple of US sites.

Problem is that they look perfect especially for a small car like I have. I do have an Outbacker at the moment but, of course, it has the disadvantage that you need to stop and swap the wander plug over when you want to change bands.

There is a local ham who manufactures a similar type of antenna but it doesn't have the interfacing to go with the FT-100, it is only manually controlled. I may end up hving to resort to that in the long run although it is a much bigger and heavier unit than the ATAS-100.

73....Eric VK2KUR.

# 11843. Re: am transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-28 17:00:01 UTC
From: backhoefade
Topic: 11805  Message: 11843

This is incorrect. The 6 kHz filter is used in both the transmit and receive AM modes. If you operate AM without it installed the rig uses the 2.4 kHz "SSB" filter in transmit which explains why the audio passband sounds distorted (muffled sounding). Not only is the effective audio passband limited but, additionally, the carrier energy at center frequency is not allowed to pass without undo attenuation due to the position of the 2.4 kHz passband relative to the carrier and sideband postions. Without the 6 kHz filter installed you get, at best, an odd sort of 'single-sideband, partially suppressed carrier' "AM". The customer data sheet for the FT-100D is clearly misleading when it states "all mode transceiver" but does not go on to advise the buyer that they must buy the 6 kHz optional filter in order to operate AM. To properly operate AM transmit the output of the balanced modulator (deliberately unbalanced during AM operation) must pass through a bandpass filter which allows the carrier at center frequency and both lower and upper sidebands to pass. One "fidelity benefit" (if you're an AM afficionado) of AM operation is that the effective lower cutoff frequency of the audio passband in AM is 0 Hz, in terms of the filter response following the modulator function. Of course the lower frequency response is actually something higher than 0 Hz, as limited by the audio circuitry between the mic and the audio input port of the modulator (plus the mic response itself). But the interesting point is that the filter passband runs right down through 0 Hz since the filter encompasses both potential sidebands' content as well as the center carrier; unlike the case with SSB where the filter following the modulator rolls off below typically 350 Hz or so and above 2750 Hz or so. That's why AM sounds "fuller", mic and audio chain bandpass response notwithstanding. If you operate the FT-100D in AM mode without the 6 kHz filter installed, when receiving it will use the "FM" bandpass filter which is very wide. I don't recall how wide; something like 15 kHz or 25 kHz for 6 dB down (the spec' is in the operating manual). You can hear how wide it is. The transmit architecture NEVER passes the transmit IF signal through that wide "FM" filter, regardless of what settings you choose. Yaesu was smart enough to make that impossible (without an internal mod anyway). If you could route the signal through that broad "FM" L-C filter you'd be wide as heck, but you'd probably sound pretty darned good! Without the 6 kHz filter installed it will use the 2.4 kHz filter. Read my post at message 10277. I get very good audio reports on AM operation.

From: Alvin M. Norris
Topic: 11845  Message: 11845

I was programming new UHF frequencies in the 100 and scanning to find new repeaters.
I noticed that the recieve audio had dropped to almost zero, even turning the audio to max just gives low volume.
I tried turning the radio off and on, letting it cool down etc. but no results. The problem is on all bands and modes.
Is their a hard reset or something to try before the trip back to the shop?
I am currently on hold with Tech Support.
Since I've been on hold for 37 minutes, I thought I'd try here again.

Have you set the FM settings to FM or WFM. It sure makes a difference!

Subject: [FT100] Very low audio

I was programming new UHF frequencies in the 100 and scanning to find new repeaters.
I noticed that the recieve audio had dropped to almost zero, even turning the audio to max just gives low volume.
I tried turning the radio off and on, letting it cool down etc. but no results. The problem is on all bands and modes.
Is their a hard reset or something to try before the trip back to the shop?
I am currently on hold with Tech Support.
Since I've been on hold for 37 minutes, I thought I'd try here again.

# 11848. How Many Filter Slots?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-29 02:19:06 UTC
From: jimzf
Topic: 11848  Message: 11848

I've been considering the purchase of an FT-100D. They are being offered with a CW filter by many dealers. If the CW filter is installed, is there still room to add an AM filter?

Tnx - Jim, K2PW

Chas,

I read your procedure for setting the AM carrier level
to 25 watts. I guess I'm missing something; but, why
did you say to initially set it at 165? Mine gets the
25 watts at about 66. That seems awfully high.

Does your's actually have to go that high to reach the
required output? Just curious. I'd be interested in
what setting other people get their 25 watts output.

Also should be included is the S/N as one would assume
that the most likely the same lot number of the
various components was used if S/N's are close...as
that seems to be the explanation for such varying
Function Menu values.

# 11850. WSJT Software and the FT100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-29 05:27:55 UTC
From: rphora
Topic: 11850  Message: 11850

I would like to know if anyone has tried their FT100 using the WSJT high speed meteor scatter software on 6 or 2 meters? I have a new FT100 with no fan mod. The WSJT software requires 1 minute transmit and 1 minute on receive. This is a 50% duty cycle but is pretty rough on the hardware. I plan to use an external 3.5" muffin fan blowing on the rear and right side of the rig to help cool things off. I have also installed the mounting bracket to the radio to act as a heat sink. The mounting screws on the right side of the radio seem to help pull heat out of the radio chassis and dissipate it to the mounting bracket.

Here are the questions:

Has anyone used the rig with WSJT s/w and what were the results?

On long VHF transmissions will the fans cycle longer than 10 seconds in receive mode to cool the PA down?

Has anyone used an external fan to help in keeping the radio cool?

Any and all comments are WELCOME!!!

KM5OL (Randy)

The answer is Yes.

If you want it, have the dealer install it before buy get it. You can do it yourself later or send it in later. Instructions are in the files section of this reflector. Take the easy way and have it installed when you buy it.

I just checked AES. You are right it was $320. They were about $280 at the Dayton Hamvention last year. If you are not in any rush we can get one there, and mail it direct. I go every year. How about ZL land? Any chance there. I'll bet it is DSE also, but there might be some other dealer in Auckland.

The nice thing about the ATAS is it's size. It would go good on a small car. It only covers 40 meters and higher frequencies.

I am also willing to get one from the cheapest dealer I can find and mail it. I do not know what will pay on Australian import duty.

The last thing is my daughter and I were talking about another trip to either VK or ZL land again. We have nothing firm but might do it. If we do, I will let you know and bring one through customs myself.

These are the options as I know them now.

Oh wait, I have seen these on Ebay several times new for around $250 US. When Yeasu first came out with the ATAS-100 they were giving them away with a new radio purchase. I have seen several hams that had the ATAS-100 (new in the box)for sale. They were a year or two old and unused. They decided to sell them because they never went mobile. A lot of Icom users were buying them. There is one on there right now that is setting at $62 with a "buy it now" price of $225. He says he will ship internationally.

I'll keep a look out for one.

Let me know if you want me to check if any of the dealers will export. It is Tuesday morning and Yeasu did not answer my emails. I think I caused them so much trouble in the past that they automatically ignore my emails.

DSE are not the Yaesu agents in New Zealand. They are sold here through Com Centre in Auckland (www.radioinfo.co.nz). They list the ATAS-100 at NZ$840.00 which at the current exchange rate is US$350.00. 12.5% tax is payable on top of this.
The FT100 is listed at NZ$3551.00 (US$1500.00) plus 12.5% tax. Strange pricing variations depending on the item. I imported my FT100 from HRO at a considerable saving on the local price, but it would not be worthwhile for the ATAS-100 as after adding freight, the price would be similar to the local price.

Grant, ZL2BK.

There is room for 2 filters the AM filter is at the front of the radio and the spot just behind that is for a CW filter ( and you can install either the CW-N (300 Hz )or the CW (500hz wide). I installed the CW-N and it works great, but it is in the circuit under the 500hz icon, because of the way Yaesu designed the software.

I have been playing with it, but my CPU is not fast enough. I think you will find its 30 seconds transmit, 30 sec receive, where the guy on the west coast transmits for the first 30 sec, then the guy on the east coast transmits for the 2nd 1/2 of the minute. i guess you also understand you should load a NTP program so you can sync up your PC clock to an atomic clock. its not really the time that matters, its getting them both to read the seconds close to each other, this way you both know when the same first 1/2 of the minute and 2nd 1/2 of the minute are.

the problem i found was it was hard to adjust the AGC just right to only get 4 bars or so. I used the same guidelines as RTTY in the manual for transmit guidelines.

Good luck,
W3WJR

Hi again Ken,

thanks for those suggestions. I will, however, try some other options first. Anoth option is that I am planning to come over Stateside in 2003 for a trip to include Dayton (of course) so if that comes off I could pick one up myself.

Do let me know if you will be coming down, however, if nothing else we can certainly show you some Aussie hospitality here in Sydney.

It certainly is not a case of wanting the antenna as soon as possible but rather I am exploring possibilities. The VK8 who replied to me said that he went down this path a while ago and was told that DSE was not importing because it would cost them too much to get them "Type Approved". I think that that is just a cop out on DSE's part but I will be pursuing it with them myself, even if it's only on principle.

The 100D comes with the 500 Hz CW filter (in the USA anyway). There is room for one additional filter, 300 Hz CW or 6000 Hz AM . The filter menu shows (and depending on mode) allows selections between 6000, 2400, 500 and 300 Hz. If you wanted both the 300 Hz filter and the 6000 Hz filter it would probably be possible to remove the 500 Hz filter and install the 300 Hz filter in its place.

I use the FT100D mainly for CW and have only the 500 Hz filter. It, along with the DSP CW filters, has worked well. I probably won't get the 300 Hz filter.

Hi Grant,

thanks for that info. I may look into that as it may prove a viable alternative. Our dollar is worth a little bit more than yours so it may work our a bit cheaper for me. Also i don't know whether the tax would apply if it is being sold off shore. would have to check that one.

Subject: Re: [FT100] Re: ATAS-100

DSE are not the Yaesu agents in New Zealand. They are sold here through Com
Centre in Auckland (www.radioinfo.co.nz). They list the ATAS-100 at NZ$840.00 which at the current exchange rate is US$350.00. 12.5% tax is payable on top of this.
The FT100 is listed at NZ$3551.00 (US$1500.00) plus 12.5% tax. Strange pricing variations depending on the item. I imported my FT100 from HRO at a
considerable saving on the local price, but it would not be worthwhile for the ATAS-100 as after adding freight, the price would be similar to the local price.

Grant, ZL2BK.

# 11860. Re: [FT100] WSJT Software and the FT100, Cooling

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-29 14:30:17 UTC
From: John Hirth
Topic: 11860  Message: 11860

Randy,

I've never used WSJT on the FT100 nor used an external fan for cooling, so I can't comment on those issues.

With regard to your other question about the fan on VHF you will find that without the thermal fan switch mod (or equivalent) there is NO temperature sensitive cooling operation on VHF/UHF. On V/U the fan will come on during transmit and for about 7 seconds afterward, and then stop, regardless of the internal temperature. On HF and 6 meters the fan operation IS dependent on the internal temperature of the rig, and the fan will run at high speed until the chassis cools, so there should be no worries there.

If you are planning long transmit and/or high power operation on VHF/UHF I would suggest you have Yaesu install the thermal fan switch on the VHF/UHF output transistors (or you can order the switch [about US$7] and do it yourself if you're handy). Alternatively, you can install a 30-50 ohm 1-2 watt resistor from either black fan wire to ground, which will force the fan to run continuously at a speed dependent on the resistance (lower R is faster). The high speed operation during V/U transmit is not affected by this mod.

All of this is discussed in K0LEE's FAQ.

From: backhoefade
Topic: 11805  Message: 11861

Function F51 gets set to about 65; your are exactly correct.
The 165 setting you're referring to must be in one of my posts where
I talk about improving the peak power capability in order to obtain
true "upward modulation". You do that by cranking up F15 (fifteen)
to about 165 or so. It just lets the rig hit a peak output power of
about 140 watts or so. You can set it first in CW (keyer disabled).
Then just follow the method using F51 to set for 25 Watts out for the
unmodulated AM carrier. You'll see what I mean if you have an
external Watt meter (I use a Bird). When you give the rig a little
more headroom for peak output power then you will see nice peaks when
you modulate in AM. Let me know how it works out. Also, try the
PROcessor, but remember to just set the level "within" the PRO
function to 17, just like you set the MIC gain when the PRO is
disabled. I have been told that for the case of using the processor
in AM mode you should set the MIC DSP to setting 1. That will take
the extreme highs out of the content and temper the overall audio
slightly. Use a monitor receiver with headphones to experiment.
Good luck and have fun!

Subject: [FT100] (unknown)

I received my FT-100D today from the Yaesu people after they repaired (under warranty) the standard SWR, heating and garbled RX audio problems. Turn around time in total was 5 weeks. The invoice returned with the unit had a "declared value" of $1,699.00. I assume this was their internal cost for repair. A person could buy two new FT-100's for that sum.

In addition to the standard mods discussed in this group, they also replaced two rotary encoders, an IC, did "AM REPAIRS" and a total realignment. I just got through trying to test the unit and it will intermittently transmits every 2 seconds, by itself, with the microphone attached. This problem ceases when the mic is detached. The mic worked fine at the time I sent the unit to Cerritos.

I can't imagine what I might be doing wrong and must assume the Yaesu let this out of their shop without a thorough test. I have listened for the most part to the comments in this group and have been amazed at the Yaesu group giving the ham community the quality of product and service I have heard about and am now experiencing. I don't want to rush to judgement on Yaesu products, but so far the "sailing" had been through rough seas.

I am going to try a substitute mic tomorrow and see if that makes a difference. Other than that, I am at a loss for ideas. Anyone out there have suggestions.....Disillusioned in Oklahoma, Paul KD5KCZ

Here is John Hansen's reply to me about the keypad for the FT100 !!

73 de N4MVL

Lee

Thanks for your inquiry about the keypad. Currently, I am selling the "Millennium QSYer", which provides direct frequency entry and a range of other functions for late model ICOM radios.

The next version of the keypad will expand coverage to the Yaesu FT-100 and the FT-817 (it will continue to work on the ICOM series radios as well). It will allow you to directly enter a frequency and will intelligently select the operating mode for that frequency. It will also allow you to do a range of other functions including switching between VFO's and turning on and off the split function. The current draw of this new version of the keypad will be in the vicinity of 10 microamps, so it will run on a 9 volt battery indefinitely (for the shelf life of the battery, in any case).

So, you might ask, when will it be available? I have essentially finished the design of the prototype and am currently running it on both an ICOM 706 and Yaesu 817 in my office. I still need to have the PC boards laid out and

contract with a company to produce the plastic cases.
Realistically, I
expect it will be available within one to two months.

Yes, there is a prototype or two floating around in
beta testing, so
you may
hear of someone who has actually used one. I could,
in fact, build one
of
the earlier models for the FT-100 and sell it to you
this week. I am
reluctant to do so, however, because within just a
couple of months you
would probably run into someone who owns one with
greater functionality
than
the one you have (when the new design is finished) and
you'd probably
be
upset that you paid the same amount of money and
received an inferior
product.

When the new design is completed, I will announce it's
availability on
the
relevant listservers and on my webpage (
<http://john.hansen.net/>
http://john.hansen.net)

Thanks again for the inquiry,

John W2FS

Ed,
Well, I did the wiring the way you told me to and
still I cannot get it to key. I just cannot figure out
what is going on. My bet is that is something so simple I am overlooking it.
I am going to read my
laptop manual to see if it says anything. Maybe I
will also go to the WriteLog home page and see if they
have a forum where I can find something out. This
is getting pretty irritating. Even more disturbing is
that you were the only person on the FT100 group
who even responded.

# 11868. Stingy S-Meter Readings (Ft-100D)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-29 20:10:49 UTC
From: kayakor
Topic: 11868  Message: 11868

Hello!
I am new to my radio as well as to this group. When comparing the signal strength with my Ft-100D to another radio (A/B test)it is very low by comparison. The other rig (Ft-847) will be almost at full scale with certain signals where the Ft-100D barely hits the 20 mark.
Any ideas or is this normal for this radio?
Thanks in advance for your help and inputs!!
73
Mike

# 11869. Re: [FT100] Re: am transmit

Chas,
You are exactly correct. I guess I looked at F15, and working with the F51 all afternoon, simply saw it incorrectly.

I do a lot of 10mtr AM in the car so these AM questions and your very good explanations are very relevant.

I have found that when I tune F51 to the 25 watts on a wattmeter and watching the SWR meter, I get a lot of downward modulation. Goes from 25 resting to about 5 on audio peaks. On the scope the carrier gets pretty thin but the modulation goes up nicely.

When F51 it set to about 72 or 73, the resting is about 40, but the downward modulation is much less as a percentage. The scope still looks nice, no flat topping on the audio peaks, the carrier has increased (as you'd expect) and the wattmeter doesn't diminish as much on modulation.

Its similar to tuning the old AM transmitters, like my Johnson Valiant et al. You need to really "load it" to get the best performance. Trying to back off, for instance, to reduce power does not provide for best performance (audio) even though the power is less.

I seem to get better reports on the audio set at the higher number. Set at 62 sometimes gets a report of "almost sounds like sideband", because the carrier goes down so much I presume. As long as I keep the carrier at 73, audio gain at 17 and the EQ at 1, all seems good.

Just an observation from my quest for good AM audio reports, Chas.

From: backhoefade
Topic: 11805  Message: 11870

That sounds good but I would still try to pump up the peak power capability by turning up F15 for about 125 Watts or so in CW. Then go back to AM and set F51 still for the basic 25 Watts unmodulated. Then you'll have a good amount of "overhead" as far as PEP goes. Try it. You should see tremendous "upward modulation" performance. The composite power peaks in the final amps will no longer starve the fundamental carrier power as both of your sidebands fill out. Did you try the PRO yet? I use it often. Just remember that when the PRO is enabled that it controls the audio drive level to the modulator entirely! Hold in the PRO function and then set it to the 17 level. You can convince yourself of this "override" behavior by turning on the PRO, setting it to 17, and then going over to the standard MIC GAIN setting and setting that to ZERO. You will then see that your audio drive level is set solely by the level control "within" the PRO function. It's a shame that the users manual is completely devoid of info on AM operation. Maybe they didn't want to have to point out that you have to buy the extra 6 kHz filter in order to operate AM! Either that or the design engineers went on to the next project before passing all their knowledge to the technical publications department! The "design is there", the operation just isn't clearly described. Sounds pretty good once you get it right though. Let me know what reports you get with the PRO on.

# 11871. Re: [FT100] Stingy S-Meter Readings (Ft-100D)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-29 21:29:01 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 11868  Message: 11871

The S meter indication is not the important thing. The important thing is signal to noise ratio at your ears. The FT-100D is reported to have a stingy S-meter but it hears very well. Many multimode radios on VHF FM go to full scale before they have full quieting. Because the meter is reading first limiter, not a true signal strength. The FT-100D may be more truthful than prior radios.

Hey Jerry.... No I was not. When the unit was returned from the Yaesu folks, after the standard mod's were performed, it performed OK for about 10 minutes, then started intermittently transmitting every 2/3 seconds. I was able to resolve the problem by substituting a friends mic. So....the mic is on it's way to Cerritos. Wish all problems could be solved so easily.....Paul

Topic: 11836  Message: 11873

Bob,

I really have not been following this thread because I do not use WRITELOG (I use TRLog), however, some of the simpler things to check if you have not done so already.

Please excuse if some of it has been covered before.

KEY JACK: 3 conductor (Stereo, male), KEY line to TIP, COMMON line to BARREL.....no connection to center.

MENU LINE #8: KYR off (not highlited)(D key)(Only used for internal keyer)

MENU LINE #8: BK off (not highlited)(C key)

Briefly touch the two key lines together (TIP & COMMON) You should hear the sidetone

If you hear the sidetone go back to MENU LINE #8 and press KEY C to turn BK on (highlighted). Radio should transmit (dummy load) when you touch the two key lines together.

All of the above will let you know the radio and key line are OK.

If you do not hear the sidetone then you have a problem in the connections or radio.

After the above checks out, assemble and plug the cable to your laptop (LPT1??). Connect a DMM (Digital Multimeter) to TIP & COMMON on the stereo plug and place the meter in OHMS (Resistance).
Have the laptop (Writelog) send some CW and see if the KEY LINE is pulled to 0 OHMS (or close...Hi). If not, then, you have a problem with the interface, software, or laptop hardware.

If you can receive attachments I can scan the interface schematic and send it to you. It should be the same for WRITELOG and TRLOG.

# 11874. Re: Stingy S-Meter Readings (Ft-100D)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-30 00:19:45 UTC
From: backhoefade
Topic: 11868  Message: 11874

I tried to post a response to this earlier today but it got lost somehow. Here we go again. Take a look at the file in the "Files" section called "ft100meter1.xls" and you can see the inaccuracy of the S meter even following a re-calibration in the engineering lab at work. You can only set the S meter readout at one point on the overall curve. The file indicates the meter performance following an alignment for S9 equal to -73 dBm (50 microvolts rms sinewave). As you can see the meter is actually extremely generous at the high end; 60 dB over S9 is indicated when the actual level at the front end is about 35 dB over S9. I posted a discussion about receiver "sensitivity" some time ago. You can find it by entering "receiver sensitivity" in the search box. In it I explain the fundamentals regarding "sensitivity", pointing out the fact that any receiver should indicate S9 if the signal is -73 dBm at the front end, regardless of its "sensitivity". "Sensitivity" pertains to the resultant signal to noise ratio that is available in a receiver as controlled by the receiver's overall noise figure and effective noise bandwidth.
If you have access to a calibrated low power meter and stable sinusoidal signal source you can go into the sub menu of the FT-100D and set the S meter so that its S9 segment is just coming on when you present the rig with a -73 dBm signal. Then at least you will have an accurate S meter reading for your "5-9" reports.

Hey Bob,

I did not see your previous message. What are you having trouble with,
I will try and help you??!

Also I did see the circuit that was explained in the text, I will redo
that with my schematic designer so you can see a better picture.

Daniel

By doing this are you smoking the CW and/or SSB and especially the FM output really high, or are you just optimizing AM?

I like 10m FM at 100"%" setting, and don't want to try to get 125 or as much as 170w out of a radio rated at 100w!

Chas,
I'm on a business trip right now and don't have access
to a power meter. I'd love to try it out tonight.

"The composite power peaks starving the carrier" makes
perfect sense and explains the negative deflection of
the power meter/SWR bridge. Anxious to try your remedy
by increasing F15. Would be comforting to see some
positive meter movement when transmitting in AM.

As to the manual devoid of the FT100 AM circuit theory
or anything else concerning AM, I'm not surprised
since the techs in Cerritos didn't have clue as to
what to do to stop the negative deflection. The one I
talked to put me on hold and asked some other
people...but still came back empty handed.

Thanks for your thorough explanation. I hope you can
put all this in the FAQ under AM Audio. Its almost a
primer on getting good results while understanding
what is actually going on in the circuit.

Randy,
With no fan mod, I think it would be in your best
interest to at least do the fan mod where you ground
one of the black fan wires so that there will be
constant slow fan speed during VHF operation.

This can be found in the FAQ or do a search on Files.

I measured mine on a Diamond sx1000 (who knows how accurate) and on 10 meter fm I get 100 watts, cw 135 Pep, SSB 110 pep. That is how it came from the factory. I adjusted F51 for 25 watts out on the meter (132 on F51) and I get around 70 watts avg or about 90 watts pep. I also don't have the mic gain set real high (30 with 40 on the processor). I have made many contacts on 10 meter AM while mobile.

Jim,

Do you happen to have any further documentation on the screwdriver antenna interface?? I am considering building one for my antenna but would like a picture of the the board and maybe some construction details if you have them or know where I might get further information.

Also, I have been trying to obtain the "Don Johnson" documents on how to build screwdriver antennas.

Any further information would be greatly appreciated! By the way your installation was very clean!

Thanks,

Jerry Hart - W7KR

Composite power peaks starving the carrier? Nonsense. Just the positive peaks are hitting the ALC and cutting the gain after the balanced modulator and filter. If the ALC is properly set for 100 watts peak output, and the carrier is properly set for 25 watts. Any ALC action comes from trying to drive the positive peaks to over 100% modulation which means the negative peaks are cutting off and splattering. Setting the ALC for more than 100 watts output is asking for splatter from the PA clipping, to say nothing of shortened life from being overdrive and overheated. Better think about water cooling if you want to run more power in such a small package, air cooling isn't going to do it. And with Yaesu wanting $200 a transistor, I don't think melting PA transistors is a positive outcome, except it stops the splatter.

I agree especially about being careful with the finals, especially considering that Motorola sold the FET line and the Co. that bought that line is not producing the MRF255 anymore resulting in a short short supply. I run my FM carrier at 75 to 80 watts and my AM at 20 watts since I have no desire to pay 200 bucks for transistors that Motorola used to charge 35 dollars for a couple of years ago.

I would be willing to write an addendum for their manual but I'm sure they won't bother with this "old beast". Hopefully future Yaesu rigs will have all the information included in the manuals. I almost suspect that the project got rushed into production before they'd finished all the details. They should have had a thorough final design review and gone through every operational aspect before releasing it. Oh well, we got it going pretty good now! You probably have notice that you have to slightly adjust F51 for higher level at initial turn-on, then drop it back a bit after the rig warms up in order to maintain the 25 Watts out. That "bug" could be corrected.

It's funny because I keep repeating how the processor level control comletely overides the mic gain control when the PRO is enabled. Yet I keep seeing these postings about certain combinations of mic gain and processor setting. When the processor is on you can turn the MIC GAIN to ZERO and see that the audio control is solely via the level control within the PRO function. Related to this, I looked at the envelope and checked the approximate percentage of compression with and without the processor enabled both in SSB and AM. What I found was that the amount of compression is a fixed amount; you can't change it. It is not affected by the PRO level setting at all. All the PRO level setting does is adjust the audio drive level to the balanced modulator in the rig. Even the manual is absolutely incorrect when it describes the "processor setting". It actually states that it changes the compression level which it doesn't. I think the compression level was around 10 dB. I recall my TS-520 had about 14 dB compression. The 10 dB is a very rough guesstimation based on rough calculation of the peak and average power of the envelope for the cases of with versus without the processor enabled.

When you have the processor on it doesn't make any difference at all where the MIC GAIN is set. You can prove this by turning on the processor, setting it to 17 for AM op, and then going to the MIC GAIN control and dialing it all the way down to ZERO. You will see that your output level is solely controlled by the level setting within the PRO function when the processor is enabled. All the PRO level setting does is set your audio drive level to the rig's balanced modulator when the processor is enabled. In other words it becomes the mic gain control when the processor is enabled. It does not control the level of compression. The percentage compression is a fixed value in this radio.

The "HF 100W" control, F15, increases the maximum output power of the rig. In CW you can adjust it for up to about 150 Watts or so. I don't know if the transmit average power is folding back in AM mode because of ALC action or if this is due to the fundamental power limitation of the PA but what I do know is that if you increase the effective third order intercept of the PA (to put it in those terms) then of course the PA will be able to linearly handle a somewhat higher PEP. The apparent drop in average power as witnessed on a Bird wattmeter in AM disappears when the PA's overhead is increased slightly. The linearity of the PA is compromised on AM voice peaks and adding a bit more peak power capability elminates the compression. As observed on an oscilloscope the AM envelope does not extend beyond 100% modulation. It's a very clean looking envelope. The audio reports on the air are very good.

If the Processor is at a fix value that is just like the FT-847. It also is why turning up the processor on SSB only changes your tonal quality of your audio and never really goes into major over drive, which is a good thing if it is set properly. I believe my processor level is a little low, because unless I turn it up to about 50 nobody can tell a difference. here is an experiment set your mic gain to lets say 40 ten set your processor to 40. ask some on the air to give you a report on the difference.

Subject: [FT100] Re: am transmit

I would be willing to write an addendum for their manual but I'm sure they won't bother with this "old beast". Hopefully future Yaesu rigs will have all the information included in the manuals. I almost suspect that the project got rushed into production before they'd finished all the details. They should have had a thorough final design review and gone through every operational aspect before releasing it. Oh well, we got it going pretty good now! You probably have notice that you have to slightly adjust F51 for higher level at initial turn-on, then drop it back a bit after the rig warms up in order to maintain the 25 Watts out. That "bug" could be corrected.

It's funny because I keep repeating how the processor level control comletely overides the mic gain control when the PRO is enabled. Yet I keep seeing these postings about certain combinations of mic gain and processor setting. When the processor is on you can turn the MIC GAIN to ZERO and see that the audio control is solely via the level control within the PRO function. Related to this, I looked at the envelope and checked the approximate percentage of compression with and without the processor enabled both in SSB and AM. What I found was that the amount of compression is a fixed amount; you can't change it. It is not affected by the PRO level setting at all. All the PRO level setting does is adjust the audio drive level to the balanced modulator in the rig. Even the manual is absolutely incorrect when it describes the "processor setting". It actually states that it changes the compression level which it doesn't. I think the compression level was around 10 dB. I recall my TS-520 had about 14 dB compression. The 10 dB is a very rough guesstimation based on rough calculation of the peak and average power of the envelope for the cases of with versus without the processor enabled.

yes that is true. I am going to dig out the service manual and see if there
is a setting anywhere for processor level.

When you have the processor on it doesn't make any difference at all
where the MIC GAIN is set. You can prove this by turning on the
processor, setting it to 17 for AM op, and then going to the MIC GAIN
control and dialing it all the way down to ZERO. You will see that
your output level is solely controlled by the level setting within
the PRO function when the processor is enabled. All the PRO level
setting does is set your audio drive level to the rig's balanced
modulator when the processor is enabled. In other words it becomes
the mic gain control when the processor is enabled. It does not
control the level of compression. The percentage compression is a
fixed value in this radio.

Topic: 11805  Message: 11889

The main point I was making was that when you enable the PROcessor then you can vary your MIC gain control between ZERO and 100 and it has absolutely no effect. That's because it's completely out of the circuit when the PRO is enabled. See what I mean? Try it. Turn the PRO on, set it to, say 65 in SSB, and turn your MIC GAIN all the way to 0. Then turn the MIC GAIN up to 100. It will have no effect on your transmit signal whatsoever. The PRO level control is simply an independant mic level control that's dedicated to the "PRO ON" mode. When the PRO is off, the MIC GAIN control takes over.

From: backhoefade
Topic: 11805  Message: 11890

The manual is actually completely incorrect where it describes the processor control setting. I think it might be in the section where they have the brief description of each menu item. They claim that it allows you to set the level of compression, which simply isn't true. So not only is the manual virtually devoid of specific operating info for AM mode, it's incorrect when it describes the processor controls. I think this is just an example of a product rushed to market without the benefit of a final complete detailed design review. Some preliminary information went from engineering into the Tech Pub department and never got updated before they released the manual.

Yes that is correct and I agree, but there must be a way to change this level just as in the FT-847 the adjustment is internal not software. I have to dig out the service manual to see if they have any thing listed in there.

Date: 2002-01-30 20:53:55 UTC
From: backhoefade
Topic: 11805  Message: 11892

Been that route. I have the service manual and there's no mention about it. My guess is the implementation is in DSP so it's out of reach in this rig. That would be great if you find something but I'd be surprised. I'll take another look at the SD but I think the function's buried away in an FPGA or ASIC.

# 11893. Re: [FT100] Re: am transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-30 17:55:37 UTC
From: lhlousek
Topic: 11805  Message: 11893

Running 75 W instead of 100W is a reduction of output of 1.2 dB or about 1/5 of an S unit which will be totally imperceptible on the receiving end. The question is, will running at 75 W instead of 100 W have a significant effect on the lifetime or failure rate of the radio. I tend to think it will but have no data or experience to support that feeling.

Lowering the device temperature usually helps so either fan mod (resistor or thermal switch) should be beneficial in that regard. One thing I notice about the radio is that it doesn't have a lot of air intake area and the fans are working against the resistance to flow caused by the restricted inlet area. This also seems to be the case in my FT1000MP MkV and even in its separate power supply. In the case of the MkV supply I could lift the cover a little a hear the fan slow down and become quieter as it moved more air. The supply always runs cool so I added a resistor to slow down the fan to make it quieter. I wonder if there'd be any benefit to adding some ventilation to the FT100.

amen,amen,amen. the 100d was the first rig ive bought that came out of the box
pulling 23 amps on am. i had to go into the po setting and back off on it, i then
brought it up until it worked right in all the modes. this should have been done at the
factory. i don't know why some people think that you are supposed to have forward
power on a constant carrier.

Thanks Paul, I was experimenting with the auto ID when my radio starting acting up. and now the auto id doesn't appear to be working. Will try it again later. Glad to know that changing mikes took care of the problem. I ordered a new mike from HRO and have it on hand if I need it.

Hey Jerry.... No I was not. When the unit was returned from the Yaesu folks, after the standard mod's were performed, it performed OK for about 10 minutes, then started intermittently transmitting every 2/3 seconds. I was able to resolve the problem by substituting a friends mic. So....the mic is on it's way to Cerritos. Wish all problems could be solved so easily.....Paul

From: backhoefade
Topic: 11805  Message: 11896

Of course you have an increase in peak power when you modulate in AM. The fundamental structure of an AM waveform is a carrier voltage phasor with a reference value of unity plus two sideband voltage phasors, each having a value of one half that of the carrier phasor, given that the modulation is 100%. As the two sideband phasors rotate, one clock-wise and the other counter-clock-wise with respect to the reference carrier phasor at the modulation frequency they will combine with the carrier phasor at one point where they entirely cancel the carrier (that's where you see the envelope pinch down to zero vertical deflection on a scope) and at another point they will combine in phase with the carrier phasor yielding a resultant voltage phasor which is precisely two times the magnitude of the carrier phasor (the widest part of the observed envelope).
Since power gain (dB)= 20xlog(V2/V1), where in this case V1 is the carrier phasor value and V2=2xV1 is the peak resultant phasor, the power gain (or increase) is simply 20log(2) or 6 dB. That all just says that the PEP value of a 100% modulated AM waveform will be 4 times or 6 dB greater than the unmodulated carrier power. If you want to call that "forward power" be my guest, the bottom line mathematically is that you have a 6 dB peak envelope power in AM with respect to the unmodulated carrier power.

Thanks to a conversation I had with Pres where he explained how he organized the FT817 group files, I decided to clean up the files section. Specifically, I put the various files into categories as follows:

FAQ
ATAS-100
Accessories
CAT
Documentation
Measurements
Mobile Installations
Modifications

I didn't remove anything and I apologize in advance if I miscategorized any of the information. It can always be moved around if necessary. In the future, I'd ask that you upload files into an appropriate category and if you are uploading multiple files or pictures, please put them into a descriptive folder.

Dave:

I ran across a CAT program called FTBasic. It is designed for FT-817
but also works on FT-100. Cost $22.50

I have not tried it.

Try this link for a review by eham.net

From: Ham_Tech@juno.com
Topic: 11904  Message: 11904

Hi everyone,

I got the FT100 Operator's Manual and the FC-20 Service Manual.

I am working on the Tuning Circuit...

A. I need to know what Tx InH is for?? Does it provide a Logical 1 at +5V when the TUN button is pushed??

B. I also need you to test if you can, what comes out of these Band Data pigtail pins when; the FC-20 is selected by the menus; the TUN button is pushed??
-specify the voltages for each pin:
1
3
4
5
7
8
C. What are the diferences between pins (3,6 - GND) and (2 - TX GND)??

D. Is pin 1; which is 13.5VDC; constant or is it only on when the TUN is pushed??

E. Does pin 7; RESET; supply a Logical 1 at +5V when pin 4 (Data In) senses a low VSWR or does it sense a logical 0 or 1 for the signal??

I would appreciate answers to all these questions.

Daniel

Sorry - I'm at work so I can't give you the detailed info but I can tell you a couple things. First, it's not in the DIN pigtail. It's one of the mini-jacks on the back. As you face the front of the rig it is one of the jacks on the left side on the rear panel.
Second, be careful that you aren't trying to key a control circuit with a high voltage sitting on it. The relay driver in the FT-100D is an open collector device rated for (I believe) 50 Volts maximum. I use an SB-220 with my FT-100D. The amp has a 120 Volt relay control voltage sitting on it so I had to install the Harbach relay interface in the amp. Works perfectly. $20 at the Harbach website.

# 11906. IF and DSP fitlers

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-01-31 15:50:08 UTC
From: lhlousek
Topic: 11906  Message: 11906

As I've done for many rigs, I looked at the filter characteristics of my FT100D with audio spectrum analyzer software. The 2400 and 500 Hz filters are somewhat wider than specified which is how they sound compared to other rigs.

The DSP high and low pass have sloped cutoffs rather than the brick wall typical of all other DSP filters I looked at. On CW the 240 Hz DSP BPF does pretty much what you'd expect but selecting 120 or 60 Hz only adds attenuation. They do not significantly narrow the pass band below the 240 Hz setting. This seems like weird behavior for a DSP filter. Has anybody else seen this behavior?

I can hear the difference between the 60, 120 and 240 Hz CW filter. The 60 Hz is definitely sharper the others. There is a bit of additional attenuation but it's clearly narrower. Guess it's all in the ear of the beholder.

You're looking at it!
What I mean is the answer is no. I've not seen anything other than the service manual. Most of your operational questions can be answered here on this web-site.

I wish there was a line into the Yaesu engineering dept and they had some engineering/ham nut who had a real hobby interest in the rig but also was a key designer. On the other hand, management wouldn't want him saying much, since then we'd all hear first hand about the shortcomings of the rig.

This website is one of you best info sources.

<<Guess it's all in the ear of the beholder.>>

I agree. It wasn't that obvious until I put in on the spectrum analyzer and could clearly see what was happening. If you want to try it, all it takes is a PC and a soundcard. The software is called Spectrogram and is available for free download from:

http://www.visualizationsoftware.com/gram.html

It will run for 10 minutes an unlimited number of times but if you want it to keep running it costs $20. It has a number of display styles including a waterfall display but the most useful for these purpose is the regular spectrum analyzer type. It's really pretty slick for seeing exactly what your filters are doing, what the effects of shift and width controls are and comparing different rigs.

# 11915. Nice quiet fans

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-01 01:14:33 UTC
From: Bob Evans
Topic: 11915  Message: 11915

Guys,

I hadn't pulled my rig out of its trunk mount in 18 months and never noticed that the fans were getting noisey on high speed; slow speed seemed fine. I was thinking about oiling them up, but in the back of my mind, I seemed to remember that oil and electrical fans were probably not a good mix. So I decided to just simply tighten up the 4 screws on each fans since I noticed they seemed loose. Viola!! Nice quiet fans! They must have just loosened up over time with the temp swings and bumps riding in my trunk. It's nice having a "new" radio again.

Bob Evans, K5WA

P.S. There's probably a previous post that says the same thing, but I don't always get a chance to read each post. By the way, I'll be looking for CW mobile U.S. FT-100s during the ARRL DX CW contest as ZF1A! Gimme a shout.

# 11916. Re: [FT100] need help, this is for your benefit!!

I've included a new page in the FAQ to help explain this pigtail connector. It's linked at the bottom of http://k0lee.com/ft100faq.html#banddata or you can go right to it at:
http://k0lee.com/banddata.htm

--- Ham_Tech@... wrote:

>
> I am working on the Tuning Circuit...
>
> A. I need to know what Tx InH is for?? Does it
> provide a Logical 1 at
> +5V when the TUN button is pushed??

The service manual labels it as an input to the FT100, presumably for the downstream device to prevent the FT100 from transmitting.

> B. I also need you to test if you can, what comes
> out of these Band
> Data pigtail pins when; the FC-20 is selected by
> the menus; the TUN
> button is pushed??
> -specify the voltages for each pin:
> 1
> 3
> 4
> 5
> 7
> 8

When configured with a Tuner, I believe that most communication occurs over the serial lines, i.e., Data In and Data Out in serial commands. I'm not sure that Yaesu even publishes the Tuner command protocol. The Data In, according to the service manual is an output, i.e., the TXD line for the FT100. Serial communication is always a little confusing because the TX of one device is connected to the RX of the other and vice versa so when you're talking about Data In and Data Out, it gets inverted depending on the device you're referring to.

> C. What are the diferences between pins (3,6 -
> GND) and (2 - TX GND)??

The service manual doesn't call pin 2 TX GND, it calls it LIN and it's an input to the FT100. In looking over the schematics, it appears to be related to the PTT circuit on the CTRL board.

> D. Is pin 1; which is 13.5VDC; constant or is it
> only on when the TUN
> is pushed??

This line is just providing power to the downstream device, i.e., the tuner.

> E. Does pin 7; RESET; supply a Logical 1 at +5V
> when pin 4 (Data In)
> senses a low VSWR or does it sense a logical 0 or 1
> for the signal??

Note also that this is inconsistent in the operating manual vs. the service manual. The operating manual shows Reset on pin 7, the service manual shows it on pin 6. It is considered an output from the FT100, presumably to reset the Tuner.

What is the fundamental frequency you are looking for? Audio freq's?
There must be some synthesizer programs out there that would let you
generate a couple audio frequency sinusoids on your PC. Then you
could patch them into your mic input and run them all the way through
to your PA output to make an overall transmitter 2 tone measurement.
What are you planning to measure?

I bought an FT-100 last summer, new, when they closed them out. I have had no real trouble with it, but it gets so hot operating that I have no confidence in its' ability to survive long. In the shack, I have put a muffin fan beside it and let it blow across the radio, but that would be impractical in the car. I am taking it this weekend to a hamfest, and I am going to try to take a loss and trade it in on an IC-706mkIIG that I can install in my car and not worry about it. I feel that the problems everyone has with the FT-100 series would be much less if the radio had a heat sink.

Hi,

It's a pity you feel that way about a good radio. Lurking here on this group, I see most of the comments are negative about some relatively minor issues compared to the whole picture. Mine is mounted in the trunk of my car here is southern California, Even though it gets real hot in the summer, I've had no trouble at all with this unit. I also have had none of the mods done to it.

My original FT-100 over 2 years old has been mounted in the small 4" deep well between my cargo floor and the spare tire in my Outback wagon. It has held up well (fingers crossed) so far in this environment in the metro Wash DC area where we are known to get 90 consecutive days of 90 deg+ temps.

My 706MKII-G gets very hot in my house.

From: backhoefade
Topic: 11919  Message: 11923

It shouldn't get extremely hot unless you do one of the following:
1) Run it for long periods on VHF/UHF without the fan mod. The fan needs to run during long periods of receive.
2) You operate HF FM at the full 100 Watts out, say at 29.5 MHz. You don't want to do that. The rig's rated for 100 W PEP with an approximate 50% duty cycle on HF so when you run FM 10 meters you want to keep it at 50 Watts out.
I don't have a high heat problem with mine. I wonder if there's something wrong with your particular unit. Sorry it didn't work out for you. You may find yourself missing the FT-100D receiver with its superior overload performance, noise blanker and variable bandpass DSP (especially if you like CW). Drop by and tell us how you like the Icom receiver.

Chas,
Had a chance to implement the changes on F15 that you suggested. When I advance F15 upward, the maximum output happens at about 140. Any higher does nothing additional and probably creates a lot of otehr problems.

Keeping either audio gain or PRO at 17, the new F15 setting pops the output up considerably on the FT100 meter. It stills shows a downward deflection on the output meter but only slighly except on extreme audio peaks.

The scope looks just fine. As a matter of fact, I tried to make it flat top and couldn't. Must be the ALC working. Am getting great reports on AM now and the signal is a lot stronger. Before, I'd get good audio reports but the signal was pretty thin on AM.

If you use the CAT100 software, there is actually a thermometer onscreen that supposedly reads some kind of temp on the PA. For what its worth, I ran the rig in the former position for about 5 mins and then in the new higher position for 5 mins. No difference in temperature. The fans don't seem to be working any harder either.

If I understand your query, then Cool Edit or Sound Forge should do this for you.

Im still learning SF, but Cool Edit can generate DTMF tones and pretty much any sound that you can think of.

# 11928. Re: [FT100] FT-100 - giving up

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-01 20:45:41 UTC
From: Bob Cheek
Topic: 11919  Message: 11928

David,

I used to have pretty much the same attitude as you did, much talk about relatively minor problems with the FT-100. But now I'm with Gary on this one.

I bought a FT-100 in October of 2000, (it was manufactured in January of '99) installed it in my vehicle in December of 2000. After a year of trouble free operation, in November of 2002 it blew up its VHF final in a low power QSO. The final went into oscillation and shorted the SRF7043 final and blew the fuses.

After waiting 9 weeks for the news, Yaesu service wanted $505 to repair the radio. I frankly couldn't see putting $500 in an $800 radio. Considering the number of similar troubles reported one would think that the manufacturer would stand behind their product and if not warrant these failures at least provide some accommodation toward the cost of the repairs.

To make a long story short, I have another $100 in shipping and charges for my FT-100 and it isn't fixed! I find that the VHF/UHF final transistor is a special part made my Motorola for Yaesu (hence the "SRF" prefix) and that you can't buy one through the normal channels. Yaesu wants over $200 for the part. So, if I can find some part I can substitute I'll repair the rig and sell it. Otherwise, it's going in the trash.

After looking through the messages on the IC-706 group and not seeing messages about the same failure modes over and over again as you do here, I've ordered a IC-706MKIIG to replace the FT-100. It is a shame, because the FT is a great rig. However, it is not reliable.

My big issue is not with the rig, all electronic devices can have problems. It is the fact that this one rig seems to have some real problems and the manufacturer is not taking care of the problems. In a conversation with the Repair Supervisor at Yaesu I was fed a line of hooey about why my rigs finals failed. It was out of warranty, that was it.....they just really didn't seem to care.

I would speculate that your attitude will change when
your FT-100 give up too.

By the way, I've got a ATAS-100 and two separation
kits that are available if anyone wants to buy
them....

I have both rigs, and they both tend to get pretty warm during operation. I like both rigs - either is a great mobile or base rig. They each have strong points - the FT-100 has a great noise blanker, and the IC706MkIIg works real well with my LDG autotuner. I would hate to see you sell the rig and take a loss in the belief that the Icom is clearly better, because it is my belief that the FT-100 is a good rig that matches up well against the Icom. I hope that other hams with both rigs speak up and tell you their opinion.

I also found the CAT100 program very nice to run. The actual picture of the FT100 and the logging module make it a nice package. It even has a thermometer for the PA temp ... although it is only a relative reading.

For some reason it had some "run time" problems on my DELL 700mhz laptop. I talked to Bob and he suspected that the laptop's touchpad or the PCMCIA modem/fax card was causing the problem. It IS in a docking station.

I have since installed it on the office P-200 and it works flawlessly.

From: backhoefade
Topic: 11925  Message: 11931

Make sure you have the "fan mod" in your rig. You can tell if you have it if the fans continue running in receive mode on VHF/UHF once it's warmed up. I don't mean the 10 second automatic fan run after every transmission either. Second, check that you have the proper "SWR mod" which is a mod which eliminates a potential spurious oscillation that typically occurs when operating on 24 MHz and 28 MHz. You can tell the mod's in there by opening up the top cover (6 screws). There should be some metal grounding strips that are screwed into the center chassis rib. If all you see is some copper adhesive tape then you don't have the proper modification for the spurious bug. Those are the only two mods you need to have in the rig. I had mine done a year ago and it's operated perfectly ever since. You are in for quite a learning experience with this rig. The manual lacks a lot of operating information. You will learn it at this website. Just type in a key word in the search box and you should find plenty of discussion. Plus K0LEE's info center is packed with information. Here's a hint for setting up the CW sitetone level. Open the top and adjust VR1004 for the level you want out of the speaker. VR1004 is next to the connector for the speaker wires. Then get some headphones with an in-line volumne control and you can then separately set your sidetone level as you want it while using headphones. Buy the mono-to-stereo adapter if you buy stereo headphones (which you will since that's generally the only type with an in-line volume control). For AM operation you need the 6 kHz filter installed. In AM you have to set the unmodulated carrier output power to 25 Watts using sub-menu function F51. In AM keep the mic level at about 17. In SSB try it around 65 for starters. 65 for the FM MIC level too for starters. Note that the PRO setting is the same control as the mic gain control except it overides the mic gain setting when you enable the PRO. Also run the PRO at about 17 for AM operation and 65 for SSB. A good compromise setting for the noise blanker is between 7 and 10. The trade-off is audio distortion. 7 is a typically good setting.

I have to agree with him about giving up on the darn radio.

I just went thru my 2nd ft100D in 6 months, my FT100D has all spurious grounding strap mods and thermal mods ETC everything is all up to date and yesterday while receiving on UHF the VHF/UHF final amplifier decided to go up in smoke for no apparent reason drawing 12 amps while in receive on any frequency and band and any mode. Mind you I wasn't talking at all nor was the radio scanning,I just had it hooked to an indoor receiving antenna without a mic connected and not even in a hot environment either. And yes the fans did come on while in VHF/UHF receive but as I said all of a sudden it started drawing 12 amps and would no longer transmit in V/U bands for no apparent reason. HF/6 meters is fine except for the extra 12 amps of the V/U final which I confirmed is partially shorted. So now while in HF or 6 meter tx it rquires a 35 amp power supply.

I won't even mention my first FT100D that died practically out of the box.

From: backhoefade
Topic: 11805  Message: 11933

This is the kind of feedback I like - right in phase with
my experience. I'm not surprised that the finals didn't heat up
with the slight peak power increase. It's the average power
dissipated in the devices that's going to bring up the temp and
although the increased peaks do raise the average power a bit it's
not much. What you don't want to do is run CW beyond the rated 100
Watts output. And when you run FM on 29 MHz pull the average power
back to 50 Watts. Glad it worked out for you. I'm setting up a
pre-amp for my D-104 mic. That's going to be interesting using the
FT-100D with a D-104 on AM. I can set the drive to my SB-220 for an
unmodulated carrier output power of 250 Watts and basically have a kW
PEP AM station with the FT100D!

David,

I used to have pretty much the same attitude as you did, much talk about relatively minor problems with the FT-100. But now I'm with Gary on this one.

I bought a FT-100 in October of 2000, (it was manufactured in January of '99) installed it in my vehicle in December of 2000. After a year of trouble free operation, in November of 2002 it blew up its VHF final in a low power QSO. The final went into oscillation and shorted the SRF7043 final and blew the fuses.

After waiting 9 weeks for the news, Yaesu service wanted $505 to repair the radio. I frankly couldn't see putting $500 in an $800 radio. Considering the number of similar troubles reported one would think that the manufacturer would stand behind their product and if not warrant these failures at least provide some accommodation toward the cost of the repairs.

To make a long story short, I have another $100 in shipping and charges for my FT-100 and it isn't fixed! I find that the VHF/UHF final transistor is a special part made my Motorola for Yaesu (hence the "SRF" prefix) and that you can't buy one through the normal channels. Yaesu wants over $200 for the part. So, if I can find some part I can substitute I'll repair the rig and sell it. Otherwise, it's going in the trash.

After looking through the messages on the IC-706 group and not seeing messages about the same failure modes over and over again as you do here, I've ordered a IC-706MKIIG to replace the FT-100. It is a shame, because the FT is a great rig. However, it is not reliable.

My big issue is not with the rig, all electronic devices can have problems. It is the fact that this one rig seems to have some real problems and the manufacturer is not taking care of the problems. In a conversation with the Repair Supervisor at Yaesu I was fed a line of hooey about why my rigs finals failed. It was out of warranty, that was it.....they just really didn't seem to care.

I would speculate that your attitude will change when your FT-100 give up too.

By the way, I've got a ATAS-100 and two separation kits that are available if anyone wants to buy them....

The easiest way is to get a TT pad from an old phone.
Very precise frequencies and you can get single or
two-tone.

Bob,

Sounds like mine did the same thing yesterday that yours did, looking at thSRF7043 circuit and being familiar with the main wafer die that the SRF7043 is made of, it's the same type die as a MaCom MRF177 which is a 28 volt part but still has a lot of gain even when operated at 13.8 volts and tends to go unstable without any type of feedback. That circuit needs some serious feedback in it especially with the wide open PWB layout in the FT100. Right now I have the MRF5015( another obsolete device BTW) driver stage jumpered over to the SRF7043 output coax and I'm getting by with 5 to 7 watts out. And looking at the specs on the MRF5015 driver, it's rated at 15 watts so maybe If I don't find a suitable replacement final I'll rematch the driver over the 144 to 450 range and see if I can get by with that arrangement, 15 watts is better than spending 200 bucks to get up to 50 watts.

Also I'm looking at an alternate source for a similar Power type of power FET right now and although I'm not sure what the price would be in small quantities, when I receive a reply which I was told will be next week then I'll post that info to the group.

It looks like an ominous trend may be brewing...uh oh! Didn't someone say
the V/U final is available from RF Parts?

Congrads on the new rig, now here's the mods you have
to put into it to make sure it doesn't blow
up.....what's wrong with this picture?

For audio frequencies you can get a progrma called cooledit
i used to generate dtmf tones with it so u should eb able to generate
whatever you want with it

Mike,

I'll be interested in what you come up with for a
substitute part for the 7043. I don't even have my
FT-100 back from service yet. But you're right, 7
watts is better than none!

From: James Carmody
Topic: 11943  Message: 11943

My FT=100D now works fantastically well after sending it in to Cerritos for the two manufacturing/design defects which are now famous: internal grounding and fan mod needs on UHF/VHF. At this point, I can honestly say that the medium sized beast (I have the 817, so the 100D is not little) is the best radio I have ever owned. It is nothing short of terrific, particularly if you learn the nuances of the menu adjustments.

However, if Cerritos is giving poor or delayed service to your defective rigs, I urge you to write QST, make the issue well known on your local ham networks and that you write the folks in Tokyo who seem to be completely out of touch with consumer matters and could care less. IN OTHER WORDS, BE VOCAL! Send a copy of this email to everyone your write and add other emails for a nice quilted impact.

From: Wilfrid Maillet
Topic: 11917  Message: 11945

Thanks for the info. Where do you thing I could get Cooledit? I thought about the TT pads. I would need two, because you can only get one combination out at a time, but that would be ok. Then you need a power supply, etc. Would be much neater if I had one wire coming out of my computer. Someone asked what frequency was required. I would have to take a look in the handbook, but I know that they need to be non harmonic related, like maybe 1700 and 700Hz.

1. Go to the Hamfest and spend $.50 on a 39 or 50 ohm resistor.
2. Go to back to your car in the parking lot with a screwdriver.
3. Remove the radio cover.
4. Install the resistor from black fan wire to ground. (The ground end of the resistor can go under the cover screw. The other end can be inserted into the back of the fan plug)
5. Replace the radio cover and enjoy the rest of the hamfest.

Net loss = $.50 and about 10 minutes time.

# 11948. Thermal switch from Yaesu

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-02 16:04:20 UTC
From: lhlousek
Topic: 11948  Message: 11948

Has anybody ordered the Tokin thermal switch from Yaesu and if so, what did it cost? I'm podering adding the thermal switch vs simply adding a resistor.

I experimented with several values of resistors and ~100 ohms seems about right. The fans don't run quite as fast as they do with 50 ohms but considering they'll be on 100% of the time it seems reasonable.

Ten-Ten International is an organization that promotes ham operation on 10 meters. One of the ways they do that is to assign 10-10 numbers to members who exchange them on the air to promote activity.

For more information check out http://www.ten-ten.org/

Good luck and 73,

it is a group of hams that join a (fee required) club
which hands out the numbers. You have to work 10 guys
with 10/10 numbers to be eligible. Then you can
register and get a 10/10 number which you give out
during contacts or contests on 10 meters. They meet
every day on 28.380.
Thanks,

# 11956. FT-100D manual

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-03 18:29:32 UTC
From: janlenp
Topic: 11956  Message: 11956

Someone out there have the manual for FT-100D that can be downloaded.
73.Len N9HKG

# 11957. Re: FT-100D manual downloaded wanted

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-03 15:28:41 UTC
From: Ham_Tech@juno.com
Topic: 11957  Message: 11957

Hi Len and anyone else in the group!!!

In Reply to Peaks@... 's message to the group::

READ THIS WHOLE MESSAGE, BEFORE TAKING ACTION.

So far, according to the things on the list I have read, a new manual is
being reconstructed for the FT100D.
---
"Just ordered the FT100D service manual from Yaesu.They
say they are back ordered due to an update currently
in progress and expect to have the manuals in-house in
early march"
---
I recently received the FT100 manual so that I could do some research
on the structure of the outputs of this fine rig.

There is an older version that was used during the testing done by the
FCC. Here is some info on how you can get it.
---
"Here is the info from a previous posting:

The schematics and manuals can be found by going to:
http://www.fcc.gov/oet/fccid/
Use the Grantee code K66, and the equipment product
code FT-100, and select
View Exhibits, to get to schematics, photos, block
diagram, parts lists and
a PDF version of the user manual. Many changes have
occurred since the
grant, but it will give you enough information to help
you make your
decision. I would also like to mention that the FT817
information was
submitted as .pdf files, whereas the FT100 was scanned
and converted to .pdf
so it won't be as nice to view as the FT817
information. I found the FT100
schematics to be unusable.

73,

Lee, K0LEE

Hi Daniel,

Since the question about the on-line manual seems to
occur quite frequently, I've updated the FAQ. Here is
some text I added to it:

The manual shown appears to be only a rough draft with
36 pages of information vs. 108 in the finished
manual. It contains no illustrations. The manual
and schematics were scanned and converted to .pdf and
you will find resolution of the schematics is not high
enough to be usable. It is highly recommended that if
you lost your manual or bought a used radio without
one, that you contact Yeasu parts (contact information
is given at the end of the FAQ) and purchase a new
one.

you can see this at:
http://roxyrox.org/k0lee/ft100faq.html#manual

So, the answer to your question is that the manual
on-line and the printed manual do not correspond with
each other.

73,

Lee, K0LEE
---

ANOTHER OPTION FOR YOU: I HAVE THE RECENTLY PRINTED MANUAL, I COULD
SCAN FOR YOU AND SEND TO YOU BY WAY OF A ZIP FILE WITH A WHOLE BUNCH OF
JPG IN IT FOR EACH PAGE.

Now you have your options.

Tell me what you would like to do about the last option.

Sincerely,
Daniel
==========

Date: 2002-02-04 06:08:31 UTC
From: theunsucks
Topic: 11959  Message: 11959

Hello,

I would like to know why one should NOT buy this radio. From reading Yaesu's web site <www.yaesu.com> it looks like the perfect all around radio, but I know that is just pretty talk and whatnot. What are things that really bother you about the radio? Does it backtalk you? Do buttons stick? Does the audio RX and TX just totally suck?

Or is it the best thing that has happened to ham radio since the start of ham radio?

I would like to also know how the antenna does as well, for those of you who have the antenna. I know since it is a multi-band antenna, it is not going to be a good as your 80 foot DX monster tower, but does it do what is advertised? In other less confusing words, would it be a good 2m/70cm/HF/6m antenna?

Thanks and 73,
Sean

Another q, (uestion)

Does the CAT cable that you can get for the 817 work on the 100d/100 as well as the 847? Or is Yaesu like some other electronice companies who do their best to make everything different to suck up all your money?

In a message dated 2/4/2002 6:23:27 AM Eastern Standard Time,
cafr@... writes:

Problems:
Out of the box it needs 2 mods done to it. (I don't think new production has
fixed these problems yet)

Extra ground strap or screw added to stop SWR icon from comming on. This
problem shows up after 6 months.

Temp Switch added to the VHF amp section to make the fans cycle on and off
during receive. This cure will make the VHF/UHF receive better after its
warmed up.

Antenna: I have heard of a couple guys having problems, mine is not used that
much and it still works perfect. No its not as good as a 80' tower, but it
works good, and don't look like hell on the vehicial (well not as bad as a
screwdriver does) and you don't need to frame mount it to stop from bending
body parts.

AM You can listen,(well if "real wide" don't bother you, but forget trying to
transmit without the added AM filter. (I know, a couple guys say theres
sounds great without the filter, but I have tried everybody's settings, and
my friends just can't understand what I am saying on AM.

Besides that, its fine.

From: w1pa
Topic: 11948  Message: 11961

btw, I called around to a couple of distributors to see if I could find the Tokin thermal switch. It's considered a "semi-custom" part, so unless there are extras laying around somewhere from a recent order, they are really tough to find. The best place to purchase one is probably Yaesu.

Nope, it's a great radio. Ergonomics are fine.

Bad points: the radio NEEDS mods to work properly, done free under warranty
or easy to do yourself. You need to buy the AM filter if you are going to
use that mode. The 300 (!) memories, without alphanumeric tags, must be
loaded manually.

Good news: John Hansen W2FS is finishing prototypes of a keypad for direct
frequency entry that will signifigantly speed the memory process.
>

The ATAS is a great mobile antenna. No, I haven't compared against larger
screwdrivers, Texas bugcatchers, CB whips w/ or w/o tuners, loops or any
other exotica. It works just as well as the monoband hamsticks. But to watch
it tune automatically at the touch of a button and load up on 40-6m is a
joy.

It is a fair performer on 2m and 440. About 2 s-units can be gained by using
a seperate 2/440 antenna, well worth doing if you can afford the space.
Saves a duplexer ( reverse splitter ) too.

Bad point: You MUST ground exquisitely well the mount and radio transceiver.

No, the FT-817 and the FT-100 share the RS-232<-->TTL level shifter CAT cable. FT-847 owners are singularly lucky, they get to plug in a $3 "null modem" cable, or make their own. The radio has RS-232 built-in. I can't imagine why mobiles and portables don't.

No, this is not good information. The FT-100 has an unusual keying/biasing scheme. A straight PTT and mic connection will not work. You NEED an adapter. It has more then a plug, wires and a socket in it.

And no, I do not know the details, but I think there is a schematic in the Yahoo!groups FT100 site's files section.

Bob, I have an interface that was sold originally with NA. I just looked for an online schematic or link to purchase and found none. I did one with a shielded patch box and a few parts in an emergency one contest.. I can fax, mail or otherwise get the information to you after next weekend. It is as home and I am not until then. If you are interested, email to k7gdn@.... I only get into this group to catch up every month or so, they go into a folder otherwise.

Use VOX mode if you have it with your HF transceiver
while in the SSB mode. This allow you to use a tone to
key the transmitter on CW with a free program like
hamscope. Full break in is possible with no hardware
connection to the rig.

We saw what appeared to be about a 1955 or so T-bird yesterday in absolutely immaculate condx. Wonder what that's worth. To keep this on the basic topic, there was a mag-mount antenna on it; maybe connected to an FT-100D.

Ditto on what has already been given.

The noise blanker is about the best I've heard in a mobile installation.

I'm just learning to use the IF shift which shows up on the screen using a sine wave and moves left or right depending on the control setting.

There are several programs available to hook it up to a computer with the CAT cable. (available separately)

The ATAS100 antenna takes the inconvenience out of band switching in the car...and I suppose in the house with the grouind plane attachment. With the push of a button you can go from 40mtrs to 6mtrs. 80mtrs is not included but that band in the car is marginal no matter what you use. I simply screw it into an MFJ mag mount on slap it on the back trunk lid. It doesn't looked like you've been skewered with a telephone pole when pulling up to a customer.

Its got so many possiblities no matter what mode you run IF the 2 mods are performed. Can't stress that enough.

Chas,
I talked to a guy using a D-104 Dynamic on 10mtr SSB a
couple of weeks ago. Sounded fine to me.

I've got several ceramic D-104's and one dynamic. If
you get the ceramic to work, please post your
findings. I'm sure you'll need more output than the
D-104 puts out but the preamp should do it.

Mostly OK, I find that the buttons are a bit small, but I have fat
fingers also...

That part sucks big time. There does not seem to be a way to program
memory locations via computer control either.

Daniel:
If you decide to scan and provide a zip file for the ft-100 manual, let me know please. I will gladly kick in a couple of bucks to help defray any costs you may incurr. I imagine lots of other guys would too. I would very much like to have a manual on my computer as well as the hard copy.
You are right, the one on the yaesu section of the fcc or whatever is not very good. I downloaded it just for the fun of it and am going to delete it it is a waste of space.

Subject: [FT100] Re: FT-100D manual downloaded wanted

Hi Len and anyone else in the group!!!

In Reply to Peaks@... 's message to the group::

READ THIS WHOLE MESSAGE, BEFORE TAKING ACTION.

So far, according to the things on the list I have read, a new manual is
being reconstructed for the FT100D.
---------------------------------------
"Just ordered the FT100D service manual from Yaesu.They
say they are back ordered due to an update currently
in progress and expect to have the manuals in-house in
early march"
---------------------------------------
I recently received the FT100 manual so that I could do some research
on the structure of the outputs of this fine rig.

There is an older version that was used during the testing done by the
FCC. Here is some info on how you can get it.
---------------------------------------
"Here is the info from a previous posting:

The schematics and manuals can be found by going to:
http://www.fcc.gov/oet/fccid/
Use the Grantee code K66, and the equipment product
code FT-100, and select
View Exhibits, to get to schematics, photos, block
diagram, parts lists and
a PDF version of the user manual. Many changes have
occurred since the
grant, but it will give you enough information to help
you make your

decision. I would also like to mention that the FT817
information was
submitted as .pdf files, whereas the FT100 was scanned
and converted to .pdf
so it won't be as nice to view as the FT817
information. I found the FT100
schematics to be unusable.

73,

Lee, K0LEE

Hi Daniel,

Since the question about the on-line manual seems to
occur quite frequently, I've updated the FAQ. Here is
some text I added to it:

The manual shown appears to be only a rough draft with
36 pages of information vs. 108 in the finished
manual. It contains no illustrations. The manual
and schematics were scanned and converted to .pdf and
you will find resolution of the schematics is not high
enough to be usable. It is highly recommended that if
you lost your manual or bought a used radio without
one, that you contact Yeasu parts (contact information
is given at the end of the FAQ) and purchase a new
one.

you can see this at:
http://roxyrox.org/k0lee/ft100faq.html#manual

So, the answer to your question is that the manual
on-line and the printed manual do not correspond with
each other.

73,

Lee, K0LEE
---

ANOTHER OPTION FOR YOU: I HAVE THE RECENTLY PRINTED MANUAL, I COULD
SCAN FOR YOU AND SEND TO YOU BY WAY OF A ZIP FILE WITH A WHOLE BUNCH OF
JPG IN IT FOR EACH PAGE.

Now you have your options.

Tell me what you would like to do about the last option.

Sincerely,
Daniel
==========

# 11973. FT100 repair?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-05 00:41:23 UTC
From: k5unm
Topic: 11973  Message: 11973

My FT100 has been in Cerritos for 10 weeks with no word back from Yaesu as to when or how much. This is the second trip back for the same failure mode, loss of V/U output. Took less than 4 weeks the first time. Having worked for Motorola Semi in Phoenix I know the process to create SRF devices from MRF. I'm not to happy about the fact that there is not a standard part to substitue for the HF finals and the custom hybrid for V/U is the pits.

Whats the longest wait time for repairs that the group knows about?

My non warrantee FT8000 was gone 12 weeks when I called, It took
another 2 to get it back. They never called, I did all the calling and
they shipped it back with a charge to my CCard without my knowing how
much.

Very Poor Service.......

Mark

# 11977. RF speech processor for FT-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-05 02:11:56 UTC
From: sp8fwb
Topic: 11977  Message: 11977

I homebrewed RF speech processor for FT-100. It contains 2 crystal filters, 2 SA602A mixers and 2 transistors. It connects to the back connector for packet radio. The microphone is Heil HMM. With the processor on,I am getting signal reports about 2S better. FT-100 with this processor is like another radio because many more QSOs are comfortable instead of being a struggle with noise or QRM. The processor does not distort although the signal loses its natural sound.

I would strongly suggest building or buying an RF speech processor for anyone who feels that his FT-100 would benefit from an extra punch. It is like adding a 500W amplifier that draws 20mA extra power.

73,
Ignacy

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-05 02:45:00 UTC
From: Blaine
Topic: 11978  Message: 11979

Hi Len,

This is cut and paste from FAQ. Saves retyping.

Blaine

Serial Numbers

Yaesu appears to use the following format for serial numbers on their amateur products:

Year of manufacture-Month of manufacture-Production Run-Individual Unit number

Example: 9D051234 = 1999, February (second month, or "D"), Production Run 05, unit #1234 in this run.

(Apparently Yaesu does not use the letters A or B as a letter in the second position, hence the first month, January, would be a 'C', February is a 'D', etc..)

Some members have reported that they are receiving models beginning with 9D at late as February, 2000 while others are getting units with serial numbers beginning with 9I. It is unlikely that the 9D units are factory refurbished but rather units that had been accumulating waiting to be updated to the latest revision level and sold as new. Refurbished products are required by law to be marked as such.

Little fellow draws 1200 ma receiving on all bands
Can be reduced by turning down the display brightness
to 50 percent...drops it to about 850 ma...
Those 3 microproccessors are current hungry...
Put a time out timer on the radio of 1 hour so that
it won't kill the battery in the vehicle if it is
hooked up to a full time power source...
It sure runs nice and cool on vhf/uhf with that simple
50 ohm resistor mod that the user group discusses with
every other posted method (50-100 ohm resistor from
either black fan wire to ground...Fans speed up on
transmit as ussual but run at low speed full time when
receiving...
Have fun with that great FT-100D radio!

Look for earlier "Deaf RX" postings. If it's what you are
experiencing, you can send it in to Yaesu for repair (beware of long
turnaround time and/or might not even be repaired).

# 11986. Deaf RX / Service Manual Part No. Info Please

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-05 04:59:34 UTC
From: georgeah6bv
Topic: 11986  Message: 11986

Would appreciate it very much if someone with a service manual could look up part number "A08980048" as described by John below.

I am not desperate enough yet to send my FT-100 out to California for a 2-month vacation.

BTW, my FT-100 had the high SWR syndrom on 10M - was cured by doing the mods on file. Have not done the resistor / fan mod for VHF/UHF since most use is on HF. I may do so just to keep the fans running to see if it cures the Deaf RX. It's just that I hate to address the symptom/s.

Also, it seems like procuring spare cooling fans would be the right thing to do. Those fans are due to wear out because of the high duty cycle application. I wonder how much they cost?

73, George AH6BV/w1

==========
I just got my FT100D back from Yaesu in California. I'm happy to report
that it looks as if they successfully repaired my "deaf RX" problem after warmup that George AH6BV so ably described (below) and several others have reported on this list. I've warmed it up and had it on now for 24 hours. So far, it hasn't lost any RX sensitivity. Hooray!

From the invoice it appears that the only part replaced was one "A08980048". I don't have the service manual or detailed parts list so I can't describe it further. Can anyone shed some light on what component this is in the schematic? Is it in the physical area to which George seemed to narrow down the problem with his heat/cool testing?

<paragraph omitted>

My FT-100 took 81 days including shipping. I called many, many times and sent many emails while it was gone. I finally got an answer after 10 weeks on one email. I received the radio a week and one half later. I have been very happy with the radio after it was returned.

By comparison I sent a radio to ICOM (for the kid next door) just after Christmas for warrantee repair. I received it back in 11 days from Washington. This included the mailing time round trip from Indiana.

I still love the FT-100, but the customer service (at least out of Cerritos Ca.) is terrible.

Mine was there 9 weeks (Sent in early November) and
the bill was $505 for the VHF final and three chip
caps in the final circuit.

I elected not to repair it, and it has been two weeks
and the radio is still not back.

Got any insight on a substitute part for the SRF7043
VHF/UHF Final? I haven't found anything as yet, and
I'm just not up to putting a $230 replacement in
there.

Hi Bill,

well, the reason for the backlit DSP button is to remind you that you have one of the DSP functions activated when you are not in the DSP part of the menu.

I s'pose you are better off learning where the buttons are so you can find them by feel rather than havingf to take your eyes of the road if you are driving. that is what I am doing with my unit. Only needs an occasional glance to check the display which is very easy to read day or night.

I have in the past had a problem with a rig which didn't have any lighting of the panel at all and was below and further into the dash from the stereo. I installed about 4 green leds in the lower edge of the escutcheon around the stereo which then illuminated the front panel sufficiently to find things in the dark.

I really wished it had backlit buttons (like the DSP button -- why did this button get preferential treatment?) I'm almost tempted to get one of those little map lights that plugs into the cig lighter jack and point it at the face.

Oh yes,

I to worked for RF power at 52nd street in Phoenix designing the first LDMOS 2 ghz parts and WLL amplifier sets and I was familiar with the SRF process also. Right now I'm looking at a company in Newbury Park California. that makes 13 Volt and 28 volt FETS as a possible sub for the V/U final, to me it makes no sense to keep putting the same SRF part in if they keep croaking.
Right now I have one of their 28 volt 20 watt devices in mine and my power is flat at 13 watts VHF and UHF which is a lot better than running on the driver stage by itself. I hope to have one of their 13 volt 40 watt parts to test out later this month.

The SRF process in a nutshell is to take an existing device and the same or similar die and then repackage it in a custom non-standard flange/package( which may and usually does have different thermal characteristics), IE it is not a prefered part anymore nor is there any data available for it from the standard data book, and then it is bonded up to meet the customers specs not Motos. all of this is done just because some MFG. (IE Yaesu for example) wants to have a proprietary device that you the end user cannot replace with another MFG. similar copy cat device, IE such as a replacement part from RF parts Co. for example.

If I understand you correctly you're saying that the device itself in terms of S-parameters and other fundamental electronic characteristics is no different than the "standard" part. It's just packaged differently. Ignoring the thermal difference for the moment, it seems to me that it would be possible to fashion a carrier for the standard device that would allow you to drop it into an "SRF" footprint. The challenge would be to get the heat out of the thing. Still, it seems to me that there must be some arrangement that would couple the heat to the chassis/heatsink. Easier said than done, I know. I found the replacement devices for the HF amp for about $67 at the "RF Parts" Co website but I guess there is no direct, available VHF/UHF replacement. Think of the good old days with a pair of basic 6146's glowing at you!

Dave,

Interesting, we tested the Astron switching supply here in the shop and found no RFI on the HF bands at all. What model was it? We use the SS-18 here.

George,
The cooling fans could be free if you don't mind snatching computers off the side of the road. I have a vast collection of the PWR supply fans and a couple of CPU cooling fans as spares for the FT 100's if they do decide to go same size and a little faster on the CFPM with the same current drain on 2 of them and just a tad lower on the one other one I have. Just a thought and what the hey ya just might come up with a really nice pooter for logging or for packet work if ya decide not to tear into it and scavenge it for fans and parts. Just a suggestion if you didn't mind and one that has not been discussed in here at all I don't think.
73 and all the best to you and yours

Hi group,
I noticed that in QST 2000 edition their is a review of the MFJ, Astron SS30M, Kenwood PS-40, Yaesu, Samlex and Icom switching P/S. For what I can remember is that the MFJ and Astron were very good as with low RFI or hash. The Kenwood was a close 3rd, the Yaesu, Samlex and Icom all showed afair amount of noise, but the Icom to be the worst of all showing alot of noise on the analyzer.
I have just purchased a Kenwood PS-40 switching P/S and I will let the group know how it performs.
Currently I am in Reno NV and when the P/S has been deliverd and I have some wire antennas setup, I will be on 15m (21.280-290) and 10m (28.500).
Anthony, w7/vk2new.

# 12010. AM TX IS VERY NARROW

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-05 22:12:28 UTC
From: kb7sur
Topic: 12010  Message: 12010

I have the 100D and I cant get the AM TX set up to work well at all. I have played with all the AM settings in the menu and in the F menu and it just isn't cutting it, very poor quality. No higher frequencies above 2000 Hz on the TX signal. Lots of lows (way too much). Mic EQ set off. I thought this thing has a 6kc filter in it for AM? It receives real good. Best rig I ever had for listening to AM but it just cant transmit AM worth beans. Can anyone help??

Hi Erik,

You need to add the AM filter. The popular opinion is that the filter is used for both RX and TX.

From: Mike May
Topic: 11973  Message: 12013

Not that easy, the bonding is totally different so the impedances are
different and sometimes the SRF devices do not have the internal
input/output matching, so no the large signal S-Pars are not the same as
the prefered Motorola part. Also the prefered motorola parts case in
some instances is larger than the SRF, especially with the SRF7043 so
making a carrier to go from a large to a small case size won't work
here. On a second note I found some POLYFET transistors that are close
to the SRF7043 in most specs, one in particular the POLYFET F1208 along
with some POLYFET LDMOS devices that may work in place of the SRF7043,
I'm still waiting on a response as to the price of these parts..

Read my posts at message numbers 10277 and 8674.
You need the filter and as far as I know it's never been part of the
standard rig.
If you like AM operation it's worth it. I get good audio reports.
Read what I wrote.

I was referring to the HF finals. MRF-255 for $67 at RFPARTS.COM
Don't know about the VHF/UHF finals.

From: backhoefade
Topic: 11973  Message: 12018

The mods are free if the rig is under warranty. You will pay for shipping it to them but not return shipping. Someone said they got reimbursed for the shipping to Cerritos but I wouldn't push that to far - not worth the hassle. If you butchered up the rig you may have trouble getting any warranty work. Hope you didn't.

I heard also that you can get the fan mod and spurious oscillation mod (so called "SWR mod") done for free even if the rig's out of warranty but they will charge you at least $75 for an "alignment". So figure about $100 to get the mods done out of warranty by the time you throw in shipping each way. The mods perform flawlessly on my FT-100D.

In a message dated 2/4/02 3:23:29 AM Pacific Standard Time,
cafr@... writes:

> I would like to know why one should NOT buy this radio...

Hello Sean

All the design problems can be dealt with fairly easily. Either by yourself
or sent to Cerritos to have all the mods done that were previously mentioned.
The radio is great after the mods are done. And you understand it's
limitations. Customer support is good for the first year under warranty.

The # 1 reason not to buy this radio is Yeasu's stubbornness to own up to the
failures due to the design flaws. Getting any straight answer from Yeasu
about what they do to your radio when they have it is almost impossible.

For this reason I have lost confidence in Yeasu.

# 12023. skip the zip

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 05:12:57 UTC
From: kg4dni
Topic: 12023  Message: 12023

hi,

at this moment I am having trouble sending the ft100 manual zip format to my home email address, so I have sent individual picks to myself, I will see if I can receive all the files zip them and do a test message to the group.

Currently I am putting all the ".tif" in a Word document, so that you can have the whole manual in the Files section of the FT100 Groups Home.

Daniel

# 12024. FT100 manual

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 01:20:09 UTC
From: Ham_Tech@juno.com
Topic: 11997  Message: 12024

Hi gang,

I hope each of you has access to the web.
You can now download each page of the FT-100(D) Owners Manual at:

I did not include the last back cover of the manual, because I found it unimportant.

1. My webpage-
http://www.geocities.com/kg4dni
Click on the FT-100(D) picture in the upper lefthand corner of the page.

2. The FT100 Groups Home-
-->Bookmarks
"The FT-100(D) Owners Manual--For personal use only!!" link

I hope this has helped all of you!!

Sincerely,

Daniel
kg4dni

PS. Sorry, the zip format I have can't seem to be sent over email. It is 6.725MB. Most of my email accounts can only take 2MB upload per file. Maybe I will try some other time. Currently I am putting together all the files in one Word Document.

Topic: 11996  Message: 12026

first thing you need to know is how many amps are you going to draw on transmit
for example if your radio draws 2 amps on receive and 20 amps on transmit in cw
your going to need a power supply that will do that all the time. most 20 amp power
supply,s will only do that part time and 16 amps full time. always pay the different
price if you can and get the meters my 100d came out of the box pulling 23 amps on
2 meters i had to adjust it.

I have an old scrap Yaesu ft757gx true all mode transciever. Does
anyone no if the am filter in it is the xf117a that we need for the
ft100d or if the one in the 757 will work?

Hi Daniel,

Unfortunately, there's obviously a daily data transfer limit imposed by Geocities that prevented me from viewing your web site (and the manual page scans) this morning. I guess I'll get to it when the interest wanes.

Thanks for taking the time to do the scan. Once I get it I'll put it into a PDF file and then (possibly? -- have to think about copyright issues) put it up on the FT100 Yahoogroup Files area.

73, John W2KI

The major culprit is the high energy coil-on-plug design they are using
these days. I swear they should license vehicles as unintentional radiators.

>
> Good luck, and check out some of the many excellent references
> on HF Mobile installations. They will give you some ideas on
> what you can do. You may just have to live with some noise
> depending on what you are driving. BTW, diesel cars do not
> have any ignition noise.. can you guess why??

Not so fast there, bubba!

Above you say "> Fuel injectors , for example, are extremely noisy!!!"

Diesels have injectors too!

I repeat this mantra over and over. Trust me, I am in the car business...

YOU, I MEAN YOU, must go to your dealership. EVERY ONE READING THIS PLEASE.
Go. Demand an audience with the manufacturer's field engineer. Take your
multimode rig, set it to AM, and show him/her the noise that extends
waaaaaaaaaaaaay beyond 30MHz.

Demand they do something about it, and they can't hide behind the "we don't
care below 30MHz" policy because it goes, in my case, up into the 400's!

Tell them it interferes with Federally licensed emergency
fire/police/ambulance/Red Cross blah blah blah.

I have done this, got nowhere. PEOPLE, flood the dealerships across the
country. Annoy the living crap out of the FSE ( Field Service Engineers )

Someday it will filter uphill.

And DON'T tell them *I* sent ya! ( wink )

Thanks

Hey there,

I can't help you with the zip format, it is too large for me to send over the email address. Maybe I could in the mini advertisement CDs, and write the files to them, they would be cheaper than a regular CD.(?)

then I could send it to each of you.

I don't have a burner, so I'll have to be at a computer that has a burner, and download the files from my website. Then burn them as data onto the miniCD.

What do you think? Could send me an SASE.

Seriously, we have a Part 15 test facility here and one afternoon for kicks we put one of the Technician's motorcycles on the test pad. That thing's electronic ignition was more than 20 dB out of spec! The story about him getting pulled over by the FCC on the way home that night is a joke that passes around here from time to time, but the 20 dB over the Part 15 limit line was an actual calibrated measurement. Of course motorcycles don't fall into the "computing device" catagory for Part 15 compliance so they're not subject to it, but it's interesting to see how noisy they really are.

Someone on this list ( a truck driver ) mentioned he could hear a Mustang pass at 60 feet. I believe it. I certainly have heard a Taurus idling next to my vehicle. This is unacceptable. It also renders useless all the suggestions to bond the panels, ground the antenna, etc. The crap is a SIGNAL coming in the antenna in the intended manner. How do you stop THAT?

A few years back someone quoted a factory directive on how to cure INGRESS RFI into the car's processor. GM suggested shielding the antenna! The reply was "how about you shield the BOX?"

Duh.

I would be glad to approach the FCC against the manufacturers and appear as an expert witness, even though I said in my prior post not to drop my name!

Could you expound on the "spec" you mention, and Part 15?

# 12048. FT-100/ATAS-100 repair/mobile install - still hi SWR on 6m/10m

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 19:42:54 UTC
From: P. J. Kerrigan
Topic: 12048  Message: 12048

Hello,

I've attempted over the past year to get a good mobile install of an FT-100/ATAS-100 in my Volvo 850. I spent a great deal of effort to get good power and ground to the radio (directly to the battery), making sure the antenna had a good ground (3/8 copper strap from the mount to the body). I'm using a Diamond K400 trunk lip mount. I've also tried monoband 3/8" antennas, also with a trunk lip mount. I'm using a separation kit with the radio mounted in the trunk.

I've never gotten the ATAS 100 to tune well on 6m or 10m. I've tried the loop balun with the feed line, putting in extra coax, putting toroids in all the power and control lines.
I sent the radio back to Cerritos for an update... it took 10 weeks and a $75 alignment fee. I got the radio back a few days ago, and ... you guessed it, the same problems.

So, I'm thinking that I've got this: Either parasitics are detuning the antenna, the power to the radio is out of spec (too low), the ground is not good at RF.

I have to admit, hearing the horror stories people have with this radio discourage me. I've been a big Yaesu fan for years, own 3 other radios.

Any Elmer's in the Bay Area who want to swap debugging this install in exchange for professional grade software/network/electronics help? Or a bottle of high-end wine?

# 12053. Broadcasting with the FT100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 22:43:47 UTC
From: shlstevens
Topic: 12053  Message: 12053

Hi folks,

I'm looking for advise on how to inexpensively hook my FT100 up to a PC sound card and/or a tape recorder. I offered to provide backup to my club's rebroadcast of the ARRL news report.

I'm looking to build a box that plugs into a 1/8 inch mono/stereo jack on one end and my rig on the other. There would be a SPST switch that would put the rig in transmit mode. (By the way, the club repeater is in the 2M band, FM.)

Does anyone have any ideas on how to go about this?

First, I'm not sure if I need to hook into the mic jack or the data jack. Also, I assume the PTT line gets shorted to ground to transmit, but I don't know for sure. Finally, besides being very very careful with the recorder or sound card output, any good ideas on how to knock the level down. Do I just need a resistor?

Thank you kindly,
Scott KB3HDV

Check the Files section in the 100 Group here.
http://groups.yahoo.com/group/FT100/files/Documentation/FT100%20Interfac
e/

In there is a PSK interface that will do what you want. Then go try
Echostation which is a simplex type repeater thingy that I have used to
make announcements via a repeater. I believe it will allow you to do a
wav file and allow you to playback through to the repeater.

Subject: [FT100] FT-100/ATAS-100 repair/mobile install - still hi SWR on 6m/10m

Hello,

I've attempted over the past year to get a good mobile install of an FT-100/ATAS-100 in my Volvo 850. I spent a great deal of effort to get good power and ground to the radio (directly to the battery), making sure the antenna had a good ground (3/8 copper strap from the mount to the body). I'm using a Diamond K400 trunk lip mount. I've also tried monoband 3/8" antennas, also with a trunk lip mount. I'm using a separation kit with the radio mounted in the trunk.

I've never gotten the ATAS 100 to tune well on 6m or 10m. I've tried the loop balun with the feed line, putting in extra coax, putting toroids in all the power and control lines.
I sent the radio back to Cerritos for an update... it took 10 weeks and a $75 alignment fee. I got the radio back a few days ago, and ... you guessed it, the same problems.

So, I'm thinking that I've got this: Either parasitics are detuning the antenna, the power to the radio is out of spec (too low), the ground is not good at RF.

I have to admit, hearing the horror stories people have with this radio discourage me. I've been a big Yaesu fan for years, own 3 other radios.

Any Elmer's in the Bay Area who want to swap debugging this install in exchange for professional grade software/network/electronics help? Or a bottle of high-end wine?

I saw the MP-1 at HRO today. I don't see any reason why it wouldn't work, especially since it has a counterpoise. It sure is lite even with the tripod attached.

Today I purchased the 80 mtr coil, sold extra, to play with on my ATAS100. It has over 200 turns on the coil.

This is a LOT easier than you imagine. Either spend $10 for Yaesu's packet data cable, or find a mouse extension cable and cut it. Some have suggested an old mouse can donate its cord, but there's no guarantee that all the wires will be present.

Anyway, the "data" pigtail on the back has 1v p-p audio in and out... perfect for sound card interfacing. Just solder on a 1/8"//3.5mm plug to the sound card.

And the separate PTT line would like to be grounded for transmit. The good news is, there is a separate mic gain control for the packet mode, which is automatically selected when the rear connector is PTT-activated.

# 12066. My personal goals for life and Amateur Radio, if it is too long and you don't have time, do what you want with it!!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 23:14:04 UTC
From: Ham_Tech@juno.com
Topic: 12066  Message: 12066

Greetings to others in the email list.

You may not have a clue what I am talking about, but keep reading to the end. Because I will share my personal goals with you. And these are the things that I am involved with at this time in life, along with 19 credit hours in college.

God Bless you,
Daniel Brinneman
PS. Most of this deals with Amateur Radio and Electronics.

A Future Solution to getting access to the "scanned" FT100(D) owners manual by way of a Compact Disc!!!
==========

Hey Mark and others,

I give up on email for these large files. I did not know that I could have lowered my resolution when I scanned them. Next time I do something like this I will try harder at making them smaller.

I am thinking of buying some large capacity CDs and burning them with the files, but making the winzip create a EXE file so that way it will automatically be loaded to your CPU.

I'll take donations for the cost of sending them out, but don't feel like you are cheating me if you can't provide a $1.00.

What does the group think about this?? Do you have any good-natured comments about how I should go about this?? This seems to be my only choice right now, as far as I understand the words typed by Yaesu on the back of your manuals, it means to me that I can copy it , but I can't recreated and print out the whole manual and sell it for my profit. I consider that stealing someone else's idea.

And by the way, if we have anyone that works at the Yaesu department in Cerritos, CA, please tell me what you have to say that the company might say about this service I am providing to the FT-100(D) community of Amateur Radio Operators???

So far I am having success with just sending 4 separate zip for the Full manual, but I keep receiving back a MAILER-DAEMON (email distributer/router {?} ) from some people, until they empty their Online Web Email Inbox.

I also appreciate everyone helping me out in this, and offering to write PDF files for me. Also I still need help with the Auto Tune Circuit by way of your FT100 (D) Menu. I know I am 'burning a new path' but I enjoy challenges, that my mind can't fathom, but my hands are itching to touch an Integrated Circuit. If some of you know how to pick and use a digital probe (reads logical 0 and 1) and also a multimeter, I would appreciate some answers to my previous questions that you can find in the Archives. If you don't know what I am talking about, and would like to help.. I will send you my questions!!

This project is for your benefit (for me later in the future), primarly because you own the FT-100(D)!! If I can't get it from you, I will resort to calling/emailing Yaesu or holding off this project until I get my own FT-100D!!

Check out my beginnings at: http://www.geocities.com/kg4dni/ Go to the drop-down box and choose the "FT100 TUN" link.

Please tell me what you thought about my website. I am a people listener/watcher and I enjoy getting feedback from people I don't know, DO know, or might not be able to speak English too well. (NO OFFENSE) Also if you know French, I can read it and understand it. I grew up most of my life in Togo, West Africa. In a little town called, Kande. Look it up on the map, it is in the northern portion of Togo, between Ghana and Benin, and below the country of Burkino Faso, which I will be doing a National Profile for, in class tomorrow, in Interculteral Communications. (On the language issue; I plan to major in Spanish, during this coming Summer and Fall.)

One last thing. You might think that I am crazy for saying this. If I have the money, God willing, I plan to major in the following:: Electrical/Electronics; Electrical Engineering; French; Spanish; Aviation; Bible Seminary (for personal development); Accounting; Business Management; Computer Science; Programming; Aviation Mechanics; Communications/Wireless Technology. And maybe German...

I am currently 20 years old, and they say, "Get all your schooling out of the way, so that you will have a good job." I plan to do this, and try my hardest to do all of my homework and studies for tests.

If you want to know what I would like to do as a career in the future, please email and ask me. I will provide a paragraph more of info. Please give me your feedback.

Now, as I think say and think to myself. "GO OUT AND GET THEM!!"

Sincerely,

Daniel

# 12067. For everyone, this message is not entirely for you, but there is a theme to grasp.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-06 23:13:34 UTC
From: Ham_Tech@juno.com
Topic: 12067  Message: 12067

Hey Garold and everyone else,

Please catch-up to reading my previous messages. I hope you have internet access!! http://www.geocities.com/kg4dni Go to the link, "FT100 TUN..." in the drop-down box.

You would not believe, that I used to be to myself- loner.. I also had very few friends and had trouble sometimes keeping them. So I signed up on this group, because I enjoyed the miniature size of the radio, and still do not have one yet. I am not in the position of being able to buy one yet. And I enjoyed its features. Used to be good at CW about 7wpm now I can only about a SORRY 2wpm. :-)

First of all I will make it clear to you and others, that I am born with a spirit to helping others out. If you can't pay me, the love I have for this hobby (which is second for my love for my God) will keep me striving for the goals I have laid for myself with my Lord's help. Even if a person's problems cannot be seen. (Basically another phrase for the word "Listening") I wish I had the same attitude and attention to helping my Mom out with this attitude of helping and giving of my time.

3 things that keep me going on these ideas::

1. If I enjoy what I am doing, and it challenges my mind and brain into deep DEEP thinking, that makes me loose my hair.--> I learn things quickly!!
2. Also if I am comfortable with my situations/surroundings.
3. And God is on my side, encouraging me through the Holy Spirit, to keep going on my ideas. (It is the Holy Spirit, who gives me these ideas!! and keeps me going on thinking)

Subitem on these notes: As long as I keep my mind on these things and the ways of my God and His will for my life; I can keep my soul and mind out of the 'gutter'!!

These message may deal with just Electronics in your eyes, but in mine there is always a theme to grasp!!

Sincerely,

Daniel

Ok, with help from Paul, may have made progress. Is the filter activated by selecting the 500 Hz option on the bandwidth selection screen? If so, it seems to be working great!

From: James Carmody
Topic: 12069  Message: 12069

I have both the 100D and the 817. The blanker in the 100D works very will and the digital noise limiter helps a little further. The best solution is the Clear Speech Speaker.

On the other hand, the noise blanker in my 817 does not appear to do anything. It may be defective or I may have one of the menu settings wrong.

# 12071. Re: [FT100] Re: am transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 03:21:57 UTC
From: John Spiceman
Topic: 11805  Message: 12071

Chas,
Just wanted to let you know that I am getting
remarkable reports on 10 mtr AM with the new settings
for F51 and F15. (68 and 140 respectively)

As I key the mic, the carrier stays at 5-6 bars (the
25 watt resting output) and pops up to the 100 watt
level on audio peaks. (as read on the FT100 meter)
This is also with the PRO set at 17 and engaged.

The fans don't seem to be overworking at all and I'm
getting reports from people amazed that #1 I'm running
the FT100 #2 that I'm mobile.

At least in my case, I'm very pleased with the
re-adjustments.

THIS IS FOR THE WHOLE GROUP.

Hi,

If you got the CD for the FT100(D) Owners Manual, would you like the files to be either in an EXE file or just listed, so that you can copy them to your harddrive??

Would you like an extra CD with different freeware programs, such as loggers, antenna designers, and/or Control of the rig you have??

Send email to me directly at:: Ham_Tech@...

With your opinions and ideas.

Daniel

Greetings,

With all these requests, I do a cheerleader jump in my mind, but still keep humble in my dealings with all of you.

I plan with another shipmate to burn some CDs for your benefit. But you may have to provide ~$4 for S/H in the USA, according to his standards. I have never sent any CDs out before.

Please remember that an Amateur Radio Operator is not allowed to be paid for his/her services, only IMHO the reimbursement.

Sincerely,

Daniel

I will try my best for those of you out of the USA to get a copy on either the internet with a PDF file, (made by a friend) or by email through me, or a CD...
This is for your personal use only and not for your profit!!!

# 12077. Re: FT-100/ATAS-100 repair/mobile install - still hi SWR on 6m/10m

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 06:13:49 UTC
From: backhoefade
Topic: 12048  Message: 12077

I'll take a BV Coastal Zinfandel; nothing fancy.
Your persistence is greater than an over driven CRT display!

Here's my suggestion.
If you have a good dummy load I would first, while leaving the rig in the vehicle and not changing anything else such as grounding at the rig, connect a 10 or 15 foot length of coax to the pigtail and connect the other end to the dummy load. So now you're out in the driveway looking a bit silly in front of your neighbors moving this "cantenna" or similar load out of the vehicle and back towards the rear of the car. Just confirm that the radio absolutely has zero trouble developing full power into that known good load at 28.5 MHz and 51 MHz even when you lay the coax across the top of the car and put the load on the trunk. Now, if you still see the "SWR" gremlin then I would say you still have a problem inside the radio. This has happened to a few guys who had already had the internal grounding fix done. If you see the problem with the dummy load then take the rig out, pop open the cabinet and re-tighten (carefully) the screw that secures the ground strap inside to the center chassis "rib". Then, again very carefully, tighten every screw you can find on the filter PCB that attaches it to the chassis (that's the PCB at the top/back of the rig. Lastly, carefully move the grey jacketed coax cable that runs along the left half of the horizontally oriented chassis "rib" (same rib that should have the grounding strap screwed into it) so that it is no longer right next to the "rib". My wife BBQ'd ribs for us tonight so that word is at the tip of my tongue. Pull the coax cable forward a bit away from the rib (actually the key is to get it away from the rear PCB area behind the center rib). If you can manage this in the car, such as with the rig on the passenger seat, while still connected to the dummy load at the end of the 10 foot or so length of antenna coax you should see the problem disappear. In fact it's highly likely that it will disappear as soon as you take off the top cover. Those internal efforts should help you even if the problem never happens with the dummy load attached but still occurs when the ATAS is connected. Let me know what you find. You may have to get creative with the internal grounding in the rig. Make sure that the grounding they did includes the screw in the rib. If you have to, as a last resort, you can (I would) try adding one more internal ground strap similar to the one that should already be in there. The fact that their original "repair" did in fact hold up for a little while tells me that there is a solution.

# 12078. Re: MODS

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 06:24:00 UTC
From: backhoefade
Topic: 102  Message: 12078

The date doesn't guarantee they were done. You have to open the rig to see if the "SWR" mod was done properly with the strap screwed into the chassis rib. You will know if the "fan" mod was done if the fans come on when the rig is warm during long receive periods in VHF/UHF. You can also tell if the "fan" mod was done by confirming presence of a device stuck on top of the VHF/UHF final amp devices. It's a thermal switch. Look at the files and photos sections here to see the proper mods.

You better confirm you stuck it in the correct filter spot in the rig.
Look in the manual for that info. Then just go to menu item 32 and
select "6.0" and it should be ready. You then have to go to AM mode
and then select "6 KHz" in the regular top level filter selections.
There you go! For AM operation find my posting titled something
like "Proper AM operation with the FT-100D" or "AM operation with the
FT-100D". Use the SEARCH feature to find the posting. You should
get very good AM audio reports.

Good to hear. Yeah, it seems you don't have to push the F15 control far at all to get rid of the compression. Now experiment with the MIC DSP. Some people like it when I set it for the lows at setting "1" but others prefer "2" for mid-range emphasis. Let me know what you find.

# 12082. FT100 Manual PDF File available for download

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 09:30:36 UTC
From: Mark Slade
Topic: 12082  Message: 12082

Hi All,

I've PDF'd the manual that Daniel supplied me and is available for download
at:-

http://www.teml.co.uk/FT100Manual.pdf
<http://www.teml.co.uk/FT100Manual.pdf>

It's about 6.6mb in size so could take a while on a slower connection..

73, Mark, M0CUK

Pres,
In the MEM mode dial into the group you want to scan. Push and hold the select knob until the FT 100 Beeps (if you have the beep on)and MCH turns to GCH. Thats all there is to it.

For those of you not in the know as well there is a way to skip the unused MEM's as well when scanning. In the MEM mode (not MT or V-A/V-B)push the step button once and you will skip the unused MEM's. To have access to these "hidden" empty MEM's do the same above and you will have the empties back.
73 Pres and Good to be able to help you for once HIHI

# 12085. FT-100 Manual in single file PDF form

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 13:48:43 UTC
From: John Hirth
Topic: 12085  Message: 12085

I've made a single clean PDF copy of the manual that will be available on same web site where Lee keeps the FT-100 FAQ file. Watch for Lee's notice to the list. I've cleaned up some of the scans that Daniel provided and done some of my own to fill in some of the pages that were missing or duplicated in Daniel's package (no problem, Dan).

So Dan, you can hold off sending out your zip files of all the pages. Folks will be able to download it themselves.

Thanks to Dan for all his efforts.
73, John W2KI

# 12086. Re: [FT100] FT-817 Noise Blanker

Yahoo group: FT100 (2002-01 — 2002-06)

I have the same experience.

Oh the ft817@yahoogroups page we have a poll asking users their effectiveness on the NB. Also, there is a tech info page referenced at the end of every email, which discusses the NB in the 817 and possible mods to help it.

Thanks

So has anyone out there actually done the swr mod themselves?, from what I understand Yaesu is charging about $160 bucks to get this done.

No, the Amateur cannot use the radio spectrum allocated to Amateur Radio for "pecuniary interest"... can't be paid for the use of the radio is one interpretation.

Other services, such as manual duplication/scanning/media conversion ( which is all you are doing, converting paper to digital ) or repair or tower rigging or mobile installation, or whatever, certainly can be done on a paid basis.

Yes, mostly, although I have seen them work on other impulse noise such as the buzz from a fluorescent light or dimmer.

Think repetitive, popping, sharp noise spikes.

When you do finally score a FT-100 ( there are at least 2 I have heard of here on the list with very expensive final amplifier repairs necessary that the owners threatened to throw away... you will want to approach them about carrying them to the dumpster for them ) you will be amazed at the quality and depth of the NB in it. No, actually, you will be amazed at the poor results of other ones compared to the FT-100!

Pres,

When you're on a memory channel in the group you want to restrict
scanning to, press and hold the Select knob (lower left corner). You'll
see GCH appear in the display. Now scanning will be restricted to this
memory group.

I'd like to thank Daniel and John for their work in
making this manual available. It is a 5MB .pdf file
and I've confirmed that it loads properly into Adobe's
version 5 pdf viewer. You can the find the manual at:

http://k0lee.com/images/FT-100D%20Manual.pdf

It's also linked to the FAQ under the topic of
'Owner's Manual Information'.

I haven't tested with Acrobat 3 since I updated to
Acrobat 5 a while ago. Acrobat is free to download,
so if you haven't updated in a while, give it a try.

You can find the free Acrobat reader at:

http://www.adobe.com/products/acrobat/readstep2.html

Pres,

I no longer have any of the early Reader versions so I can't directly answer your question as to whether the PDF manual is readable by old Acrobat Readers.

Acrobat Reader version 5 can be downloaded FREE from Adobe's web site. Here's a link that get's you directly to the download page. (Older versions are available on the web site too, if for some reason you need to go backward after installing Version 5).

FYI - Acrobat Reader 5 runs slowly on any computer around a 400Mhz processor - I'm using V4 on my Dell 400Mhz, and V5 on my 1.2Ghz computer. There's a definite speed difference.

# 12099. [FT817] Re: Ignition noise

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-07 19:33:47 UTC
From: wb4eje
Topic: 12035  Message: 12099

Here's something that I found very interesting......

When I had the FT-100 in my Ford F-150 the ignition noise was basically blanked out by the noise from the electric fuel pump. The noise blanker in the FT-100 is one of the best I have ever seen, however it was not very effective against the fuel pump noise because of the severe duty cycle. (ignition spark noise has a very short duration and is more easily blanked)

Last night I installed the replacement for the FT-100 (VHF/UHF Final FET shorted) which is a IC-706MKIIG. I can't even hear the fuel pump! Same vehicle, same antennas, same coax cables, same outboard speaker, same power connection, the only difference is the radio. I hear ignition noise, but not the fuel pump.

Makes me wonder if the fuel pump noise was coming into the FT-100 via the power input rather than through the antenna?

My understanding was that they will do it for free even if it's out of warranty. You have to pay for an "alignment" which is about $75 plus return shipping but charge for them to correct the original design problem. No one should have to pay for the "SWR" mod. It's a basic design flaw, just like the fan issue at VHF. No question about it.

After getting Acrobat Reader 5 ( it will NOT work with 3 ) it is GOOD!

But, how do I store it to my HDD?

When I click on the link in the email, it OPENS but no option to download.

IF there was a link tot he file on webpage I suppose I could right-click to
download.

Pres,

If you've got the PDF file open in Acrobat Reader 5, you should be able
to select "File/Save a Copy" from the reader's topmost menu bar. There
are other ways to save a copy, but they depend on your browser/version.
Mine (IE6) asks me "open or save?".

When it opens, there should be a row of icons in the
browser. The third one from the left looks like a
floppy disk and if you click it, it will ask you where
you want to store the file. Let us know if it works
for you.

the fuel pump runs through the ignition switch with most other stuff and you get its noise along with every thing else unlike GM and Daimler who frame grounds and relays many items, look under the dash on many of them. got your recall on the
ignition switch yet. gets hot doing all that work the extra wires make good ant. too
i don't recommend anything but some people have broken the ground at the fuel pump and put it to frame ground there. Some have added parts at the pump. ford
has know about this problem for years and will only fix it on a one on one basis.
Got warranty by the way it doesn't matter if you put it to the battery the noise will
run through the wires to the post to the wires you connect your radio too.

# 12105. DC Path Accessories that work with the ATAS

It is all bands on the HF side.

Just after I said it has been working fine for 2+ years my FT100 mobile has died. No TX output on all bands. The ATAS I had bought with it died a couple of months back and now my poor FT100. Hopefully it is not a major repair.

Just thought I'd ask but does anyone know why would a recently shipped radio need an alignment ? If adding the grounding straps really screws up the tuning then they really do have a design problem that should be covered by warranty. Maybe it's just a way to get some bucks for all of the warranty work ?

You figured it out. You could argue that they shouldn't charge to do the mods even after the 1 year warranty is expired. But on the other hand they have to draw the line somewhere, otherwise they'd be supporting radios for free 5 years after they're sold in some cases.

I'm getting a little nervous hearing about all these final amp failures at the 1 to 2 year old point. Mine is about 14 months old. Between the reliability issue, the fan and spurious oscillation design bugs and the lack of accurate and complete info in the manual I will be taking a serious look at other rigs in the future. I may unload this FT-100D at some point before it's final amp heads south. Darn, I wish someone else had the equivalent performance without the reliability issue. The 706 receiver just doesn't cut it for me, especially for crowded CW operation. Plus the FT-100D noise blanker is great and I like to monitor above 460 MHz - so the 706 is out. The TS-2000 is a possibility but that's a larger package.

I want the equivalent of an FT-1000MP inside an FT-100D box with long term reliability akin to something the Navy Seals would feel comfortable dragging all over the worst war theater on the planet! Where is my radio!

> > The FT817 is the perfect little rig to take vehicle shopping. The MP-1 on a mag mount will cover most of the HF band and the FT817 hears pretty well. I did this when I went shopping. I walked away from a few too.

I was thinking of the numbers yesterday...

Please check my thoughts, and even the math, and the hard numbers I have plugged in for population and other percentages.

To use JUST one manufacturer, Ford, as an example. The numbers for GM are somewhat bigger, Toyota somewhat less...etc etc.

Theory:
700,000 US hams
70% active
40% active mobile
20% in the market THIS YEAR ( my guess is 20% of ANY population is in the market at any given time, since most cars are traded in on a 5-year cycle, or MUCH sooner in reality, like 2.5 years, which would double some percentages below )

=56,000 or more mobile hams shopping new vehicles THIS YEAR

facts:
16,000,000+ total US new car/truck industry ( trust me on this number )
~30% Ford share ( also trust... )
=4,800,000 Ford yearly US sales

1.17%=mobile hams shopping NOW as a % of the total US sales
now, here's where I may take a wrong turn in logic...
4.38%=hams, shopping or not, as % of total US new industry this year
14.58%=hams, shopping or not, as a % of Ford sales this year.

So, 1.17% of the people shopping 800 different choices of makes/models CARE about ignition noise
over 14% of Ford's ( alone ) customers care about ignition noise and may make a decision now or in the next few years based on noise.

We haven't even DISCUSSED fleets such as Red Cross, Fire/Ambulance/Police etc...

Do we think OVER 1/8 of the customer base's needs is an opinion the manufacturers want to pay attention to?

I say YES. ( Can I get an AMEN!?!?! )

Now, what do WE do about it!??!?!?!

Gary,

If you have the radio apart with the power amp section facing up pull the 2 plug in coax cables near the right center of the radio, these are the drive cables to the 2 power amps and they are closest to the center rib on the V/U power amp side. I don't remember which is HF drive as I don't have a schematic in front of me so that's why I say pull ( unplug) both cables. Take a volt meter and place it on the input side of one of the MRF255 HF finals and key the mic and see what the gate voltage is at, repeat this for the other MRF255. Don't worry, with the drive cables unplugged your meter is safe from RF. The gate voltage should be under 9 volts, if it's higher say like 13.8 volts then I'd say you have a gate punch thru problem and the device is dead. Also check the MRF5015 driver in the same way, it is under the black foam material that the VHF/UHF output cable is snaked thru. Also check for 13.8 volts on the drains of both of the MRF255's. If the gate voltages seem fine under 9 volts but also not 0 volts during TX then check for a broken wire around the rf input or output transformers, I had a cold solder joint on mine that was about to go but I caught it in time.

Chas,

I wouldn't mind the next generation radios having a nice small control head like the FT100D but with a medium sized or even large sized trunk mount RF unit with some serious fins on it and some serious isolation between the stages AKA a Moto or GE land mobile radio, R ya listening Yaesu design engineers or marketing types ? I still have my 110 watt GE rangr with the frequency agile S990 head and it never slumps power even down in Phoenix in the trunk in the summer, of course it doesn't have all modes and all bands but the size was never a problem, I could even throw it under the seat in a rental and it still worked. Just think what Yaesu, Icom or Kwd could put in a trunk mount box the size of a GE Rangr or moto Syntor ? Oh well I guess I have to stop dreaming as it would never happen, they being the designers or maybe I should say the marketers would never listen to a customers suggestions would they ?

The alignment fee referred to out-of-warranty radios. I had asked them
about my 18-month-old FT100 and the mods, and they said they would do the
"updates" free, but charge for shipping and alignment.
I'm sure they could say that they want to make sure no misaligned radio
leaves their facility. But yes, it is a way to receive payment for work
that should be free.

Check the files area, I put up pictures of the filter locations and
you can check to see if you installed it right, you must turn it on
as well in the menu. The board you installed replaced the original
osc. You simply remove the original and replace with the tcxo-8. Save
the old one in the original tcxo-8 box so you dont lose it..

Or a
> bottle of high-end wine?

Forget the wine, Jack Daniels is fine :-p Anyway, there are a few
things to go over first as these are quirky radios. Make sure with a
voltmeter that you are seeing over 12.5 volts when the vehicle is
running. Go to the local auto parts store and grab two "Help" Brand
braided engine grounding straps and mount them to each side of the
rig, then ground them to the chassis next to the radio. Add an
additional braided ground to the mount (I have a Lakewood License
plate mount and its perfect for the atas antenna) It comes with a
small ground wire which you attach to the trunk lid. I ran it thru
the license plate light into the trunk and attached it right inside
to the underside of the lid.
I then inverted the supplied connector and threaded the atas to
the inverted pl-259 to thread mount and used soldered lugs to connect
the coax to the threaded end and the shield was grounded to the mount
( I water proofed the end of the coax and lugs with shrink tubing.) I
also replaced the license plate sscews with the ones Lakewood
supplies so it doesnt pull the plastic retainers off of the plate and
you end up dragging the antenna down the street.
Then Run a large, double fused,negative and positive lead to the
radio location directly from the battery and rid yourself of the
Yaesu fuses as they stink (they corrode if they are outside and you
cant tell they are failing.)
Keep the coax long (15-20 feet to start) and roll it into a circle
of about 10 turns with a center diameter of about 7-8 inches secured
with ties near the antenna, you can play around with that length to
get good matches on every band. Dont use anything too thick, just go
with the thin coax as its good enough, believe me I made 1000's of
contacts with the atas/ft100 combo.
Forget running the ATAS on VHF and UHF, you will spend most of your
day talking to yourself and some duplexers will not pass the voltage
signals to the atas correctly. Use a separate antenna (I use a
Cushcraft mag mount dual bander for those bands. The most important
thing is the grounds, the voltage supplied to the rig and make sure
your not too close to the rear defroster grid as this will cause
problems as well. From time to time, hyper extend the antenna and
remove the boot, clean the coil and the ball bearings, re-tension the
springs and reassemble with some nonconductive lube. Silicone spray
the boot inside and out and reinstall. Aslo make sure your menu
settings are correct and remember that the FT100 doesnt know where

the atas is, it only knows when there is a match and then it judges direction by your band changes, any manual tweaking of the antenna will make the antenna travel in the last commanded direction when you auto tune so keep that in mind.. Let me know if you need more help.. Regards.. Richy N2ZD

Lee,

Any chance of zipping it up to make it a smaller download? I have no idea what your HD space is like at the server.... That way one could go in with a FTP program and speed the dl up a bunch if it was zipped...

Just a thought.

Actually, PDF compresses the file so I'm not sure that zipping it would create a smaller file. Also, the PDF has the advantage of being able to browse it or print it which isn't as easy if it were a compressed set of tiff images. John also added a bunch of bookmarks to the .pdf file that allows one to navigate the file to find a particular topic.

Thanks! All seems to be working normally.. Even got the tcxo
calibrated, whew finding a small non metallic screw driver was hard! Do
you have the AM filter? If you do, have you used it on Aircraft bands?
Greg

Check the files area, I put up pictures of the filter locations and
you can check to see if you installed it right, you must turn it on
as well in the menu. The board you installed replaced the original
osc. You simply remove the original and replace with the tcxo-8. Save
the old one in the original tcxo-8 box so you dont lose it..

Subject: [FT100] My personal goals for life and Amateur Radio, if it is too long and you don't have time, do what you want with it!!

Greetings to others in the email list.

You may not have a clue what I am talking about, but keep reading to the end. Because I will share my personal goals with you. And these are the things that I am involved with at this time in life, along with 19 credit hours in college.

God Bless you,
Daniel Brinneman
PS. Most of this deals with Amateur Radio and Electronics.

A Future Solution to getting access to the "scanned" FT100(D) owners manual by way of a Compact Disc!!!
==========

Hey Mark and others,

I give up on email for these large files. I did not know that I could have lowered my resolution when I scanned them. Next time I do something like this I will try harder at making them smaller.

I am thinking of buying some large capacity CDs and burning them with the files, but making the winzip create a EXE file so that way it will automatically be loaded to your CPU.

I'll take donations for the cost of sending them out, but don't feel like you are cheating me if you can't provide a $1.00.

What does the group think about this?? Do you have any good-natured comments about how I should go about this?? This seems to be my only choice right now, as far as I understand the words typed by Yaesu on the back of your manuals, it means to me that I can copy it , but I can't recreated and print out the whole manual and sell it for my profit. I

consider that stealing someone else's idea.

And by the way, if we have anyone that works at the Yaesu department in Cerritos, CA, please tell me what you have to say that the company might say about this service I am providing to the FT-100(D) community of Amateur Radio Operators???

So far I am having success with just sending 4 separate zip for the Full manual, but I keep receiving back a MAILER-DAEMON (email distributer/router {?} ) from some people, until they empty their Online Web Email Inbox.

I also appreciate everyone helping me out in this, and offering to write PDF files for me. Also I still need help with the Auto Tune Circuit by way of your FT100 (D) Menu. I know I am 'burning a new path' but I enjoy challenges, that my mind can't fathom, but my hands are itching to touch an Integrated Circuit. If some of you know how to pick and use a digital probe (reads logical 0 and 1) and also a multimeter, I would appreciate some answers to my previous questions that you can find in the Archives. If you don't know what I am talking about, and would like to help.. I will send you my questions!!

This project is for your benefit (for me later in the future), primarly because you own the FT-100(D)!! If I can't get it from you, I will resort to calling/emailing Yaesu or holding off this project until I get my own FT-100D!!

Check out my beginnings at: http://www.geocities.com/kg4dni/ Go to the drop-down box and choose the "FT100 TUN" link.

Please tell me what you thought about my website. I am a people listener/watcher and I enjoy getting feedback from people I don't know, DO know, or might not be able to speak English too well. (NO OFFENSE) Also if you know French, I can read it and understand it. I grew up most of my life in Togo, West Africa. In a little town called, Kande. Look it up on the map, it is in the northern portion of Togo, between Ghana and Benin, and below the country of Burkino Faso, which I will be doing a National Profile for, in class tomorrow, in Interculteral Communications. (On the language issue; I plan to major in Spanish, during this coming Summer and Fall.)

One last thing. You might think that I am crazy for saying this. If I have the money, God willing, I plan to major in the following:: Electrical/Electronics; Electrical Engineering; French; Spanish; Aviation; Bible Seminary (for personal development); Accounting; Business Management; Computer Science; Programming; Aviation Mechanics; Communications/Wireless Technology. And maybe German...

I am currently 20 years old, and they say, "Get all your schooling out of the way, so that you will have a good job." I plan to do this, and try my hardest to do all of my homework and studies for tests.

If you want to know what I would like to do as a career in the future,
please email and ask me. I will provide a paragraph more of info.
Please give me your feedback.

Now, as I think say and think to myself. "GO OUT AND GET THEM!!"

Sincerely,

Daniel

Greetings to the group,

From reading this note to myself, would this interest you??? It has interested two people so far.
---
Hey to me!!

Take the FT100 PDF file, ATAS-100 Schematics, FC-20 Schematics scanned, Lee K0LEE's FAQ, and anything else that deals with the FT100(D); i.e. carrying packs, swr mods and installations from the yahoogroups files; and burn to CD #1.

Then search the internet for freeware programs to burn to CD, (put them in Zip format) and then compile links to shareware programs, that need to be paid for in a word document with screenshots of the programs, burn to CD #2.

If you have an idea of what you would like to see on the disks, or if you have a website that would fit in this category, or have some pics from your mobile installations......

----> FOR THIS MESSAGE ONLY: Please send your ideas, links, pics, or anything having to do with the FT100(D) to: KG4DNI@...

Thanks,

Daniel
kg4dni

Hi guys,

When the PDF file is opened through the website, it has its own taskbar.
Look for the floppy disk symbol and click on it. A window will pop up
and ask you where you would like to save it on your HDD and with what
name.

Sincerely,

Luke

# 12129. Hum on 40m only

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 11:41:07 UTC
From: sp8fwb
Topic: 12129  Message: 12129

On 40m on transmit, the signal seems to sound like a 60 Hz hum. This is in all modes at any power level. I changed from power supply to a battery, and the problem is the same. I saw something similar in my IC-735 years ago when PLL for one band was getting weak, but that appeared on 0-8 MHz and in rx also. With FT-100, it occurs only when transmitting and only on 40m.
Any idea?

To the group

Does anyone know if there is an FT100 service manual available. If so, that would be an excellent document to make available in .pdf format.

Thanks to the originator of the owner manual .pdf file, I can now produce a mini-version of the relevant book (which has the most used information and functions) and keep it in the car glovebox, instead of my photocopied/reduced version.

Cheers

Yes, they are terrific!

But, is there any chance it could be converted to ver 3 without losing
critical functionality?

I know it works on 4, and I shall try that, but someone mentioned 5 is a dog
"on 400MHz processors" which I presume means it needs even more.

One great use of this project is to have a mobile version of the manual,
indexed, for when traveling. I usually travel with a Libretto 50 which is a
Pentium 75..:(

John,

My FT-100 smoked the VHF/UHF finals on a low power (25%) UHF QSO. The problem was traced to the final stage going into oscillation. The "SWR" mod most likely would have helped this problem as it beefs up the grounding. I would suggest that you perform the mod (listed elsewhere on this group) or have it done by Yaesu.

# 12140. Re: [FT100] [FT817] Re: Ignition noise

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 14:55:35 UTC
From: Bob Cheek
Topic: 12035  Message: 12140

Both rigs were grounded the same.....through the coax
and the power return. No other ground. The FT-100
doesn't have ground lug, the IC-706 does, but it is
currently not connected. I plan to put a ground to a
body bolt this weekend and check for any difference in
noise.

When I have a minute I will try the FT-100 in there
and wind the power lead around a ferrite and see if
the noise it being conducted into the rig via the
power supply.

# 12141. Active Mobilers

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 15:14:19 UTC
From: russthom@attbi.com
Topic: 12141  Message: 12141

Prez Wrote:

>700,000 US hams
>70% active
>40% active mobile

You assume that all 40% of the mobilers are worried about ignition noise? Frankly, In my experience, the only people worried about ignition noise are HF types. FMers, like me, usually don't worry about ignition noise as FM is fairly immune from ignition noise. Those I know that have it usually can knock it out with a filter in the power line. This is not easily done with the HF rigs pulling 20 amps.

I think you'll find the HF mobiler percentage much less than 10%. at 10% of the active hams worried about ignition noise, that breaks down to 61 cars / car type. Not enough to make a manufacturer change design.

We are fast to say that interception of unwanted radio signals on TVs, etc is the fault of the receiver, yet, our receivers can't take spurious emissions either. Sounds hypocritical to me

Could be just shop policy to at least check the alignment when a radio is in the shop - we do (but we don't charge $75). That should be a free service. If the factory is shipping the radios off freq., that's another story.

# 12146. ATAS on 80m

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 10:02:40 UTC
From: Ham_Tech@juno.com
Topic: 12146  Message: 12146

Hi Bob,

It is my understanding that... It would do you no good to add an 80m coil, partially because by you choosing either ATAS-1 or ATAS-2 the radio has been configured at the manufactor's lab, for it to only transmit on the bands that the ATAS-100 can transmit on. But what I just thought of now, is that in the manual it mentions that the ATAS-100 could resonate on 17m or 30m, if tuned appropriately..

That makes me wonder about what the FT100(D) can actually tranmit on (bands); even if the ATAS-1 or -2 are selected?..

Daniel

# 12147. Learn to solder easily with these tips!!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 10:30:49 UTC
From: Ham_Tech@juno.com
Topic: 12147  Message: 12147

Hi,

Make sure that you have a variable soldering iron.

Adjust the temperature on the station (soldering iron holder also the power distributer) so that the tip will be hot just enough to melt the solder.

Make sure that you have tinned your soldering iron tip. This will allow quick heat transfer from the tip of the soldering iron to the solder on the board. If the heat is too high it might effect the life of the components around the coax connection point.

The way to tin your tip is to wrap solder wire around the tip while it is still cold. Just as if you are trying to wind an inductor over a pencil. Then turn the heat on, you want to adjust the power output of heat to about 250 - 350 Centrigrade; this should heat the soldertip to the point of melting the solder.

To apply maximum heat and not be on your board for a long time; which could possibly generate too much heat and burn the board; practice these tips:

Look at the tip.
--A large tip allows more heat to pass to the board. Larger than the O.D. (this is not abbrev. for overdose; it means Outside Diameter, and I.D. means Inside diameter)
--A medium tip about the size of the I.D. of a drinking straw, will give you the right amount of generated heat. This is recommended for this job.
--A small tip about the O.D. of a hot beverage stirring straw, can give you the least amount of heat for desoldering I.C. (Integrated Circuits). If you see that your IC sweated, then in my experience you have a dead chip.

Using the small tip, you see that most all tips have a point and an angles directed to that point. If you were to take the tip and using it as if you were going to write a letter, then you would burn a hole in the board, and only get the solder around the tip heated up. This way is only good if you do not want to pass much heat, but not good for a board that has a whole bunch of mini ICs on it.

The thing you want to do, (I will revert back to your Art classes. You know when you used to do shading on an object, to create a shadow, you would basically lay the pencil on its side and slide back and forth on the paper. If you wanted to draw a line, then you would use it as if you were to write.) is lay the tip flat; avoiding any other ICs. This will

transfer heat really quick, allowing you to pull the coax off at the same time.

MAKE SURE THAT YOU WEAR SAFETY GLASSES. AND THAT YOU ARE NOT TIRED WHEN DOING THIS PROJECT. AND THAT YOU HAVE ENOUGH HEAT.
ALSO MAKE SURE THAT YOU ARE NOT FULL OF STATIC, THIS CAN CAUSE DAMAGE TO SOME CHIPS.

I hope this has helped, you and the group.

Another source for learning to solder, which also has pictures, is found at : http://www.elecraft.com Look for the Soldering Tips link.

Hi John,

mine bit the dust while in receive, I was not tasnsmitting at all but listening to the local PD on 154 MHz when I smelled something overheating'. I felt the side of the radio and it litteraly burnt my hand so I turned it off and headed for home. I got home and put the radio on the bench supply and found it drawing 12 amp in receive in all bands and modes under any condition. It wasn't stuck in transmit either as it was still receiving fine but just drawing 12 amps all of the time and that's when I suspected the VHF final. Sure enough it was shorted drains to gates. So I guess it's a toss up as to under what conditions it could happen.

You are confusing receivers picking up off-frequency signals (such as TVs that are overloaded by a nearby ham signal) with receivers picking up on-frequency signals (the mobile noise that is generated within the ham bands by the vehicles.)
Hams are required to keep their spurious signals below a certain level, and all rigs sold meet this spec. The "unwanted signals" from the vehicles are on frequency, and therefore are not the fault of the receiver, but should be eliminated at the source.
There is nothing hypocritical about it...we must keep our signals out of other bands, and ideally, other signals (such as RF noise) would stay out of our bands.
73,
Paul K4PDM

Dave

Don't mention the spectra, it makes my mouth water just thinking of having one. If only there was some frequency agile software for the spectras like there is for the S990 ge. Oh well wishfull thinking, just like imagining that somewhere out there exists a low band version of the spectra.

# 12152. Re: [FT100] Those failing finals

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 15:29:40 UTC
From: Mike May
Topic: 12131  Message: 12152

Bob, John

Mine has all of the SWR/ grounding/ fan mods but it still croaked and as I mentioned in an earlier post it happened in receive so go figure that one out. May have been a voltage spike or something so I now have a 15 volt transzorb surge supressor across the 13.8 volt line at the radio input connector and similar supressors on the bias line of each PA section.

Hey Bob.....You can tell if the RFI is conducted by removing the antenna. If you still hear any or all of the RFI, then odds are it is conducted. You also might try removing the coax from the antenna to the transceiver as it sometimes will pick up RFI. Automobile RFI usually comes from multiple sources, as I am sure you are aware. If you do determine that you have conducted RFI, resolve it first, as it is usually the easiest RFI to cure with inline filters. Then see what RFI is left, search out the source with a "sniffer" and take care of it.....Good Luck, Paul KD5KCZ

From: David Kiwerski, Sen. Comm. Tech.
Topic: 12087  Message: 12154

Hi Mike,

On further checking, there was not a low-band Spectra, only VHF-HI and higher. The VHF did come in a remote mount 110W version. Vertex (Yaesu) has a low band version, 100W that we use - very reliable.

Dave wp2aat

Mike,

I didn't realize that yours went south while receiving! That really sucks! I listen much more than I transmit. When mine smoked it was probably on the second or third time I had ever used it on UHF, but at least I was transmitting!

Like you said in your other post, maybe a voltage spike took it out.

I was talking to my friends on the way home from a hamfest. I smelled something, you know, that very specific but hard to describe smell of electronics burning.....anyway, I noticed the HiSWR indicator and shut down the rig thinking my Larsen Dualbander had finally given up. I checked the antenna the next day and it was fine. Put the rig on the bench with a dummy load and Bird wattmeter. I noticed the power was all over the place. My Scanner monitoring the Sheriff Department was getting desensed by something at the same time. I hooked the frequency counter to the -20dB port on the dummy load and it was wandering between 200-300 Mhz. Then the final FET shorted.....

Probably need to add some feedback in the circuit when the new FET goes in too....

> as FM is fairly immune from ignition noise.

Just because you can't hear it, doesn't mean you are immune. The inaudible ignition noise is S8... you don't think it is covering up weaker 6m/10m FM signals? Yes, it is; when the vehicle is shut off you hear stuff much better. The FT-100 NB is disabled in FM!

Those I
> know that have it usually can knock it out with a filter

> Sounds hypocritical to me

No, the problem is radiated. Signal. You can't escape it with power filters, grounding, whatever. It follows you as you drive. It's there at the frequencies you are receiving, not spurs.

I suggest that you never run over 50 Watts FM on 10 or 6 meters since the rig is thermally designed for 100 Watts PEP on a 50% duty cycle basis which is roughly 50 Watts average power.

Just a thought - would a small Peltier Junction mounted on the finals help - or maybe an exhaust blower - it seems to me that the solution is in getting heat pulled away from the finals board quickly. Maybe we should take a page out of the Computer Handbook and look at the way they cool the processors!

Folks, I?ve been using an ATAS100 in my base stations without good reports, or better, sometimes it?s virtually impossible transmiting due to high SWR. Could you give some tips regarding radials, maybe, in order to get better results. Even in ny car (BLAZER) I can?t get good ones ! Tks --- Ham_Tech@... wrote: Hi Bob,

It is my understanding that... It would do you no good to add an 80m coil, partially because by you choosing either ATAS-1 or ATAS-2 the radio has been configured at the manufactor's lab, for it to only transmit on the bands that the ATAS-100 can transmit on. But what I just thought of now, is that in the manual it mentions that the ATAS-100 could resonate on 17m or 30m, if tuned appropriately..

That makes me wonder about what the FT100(D) can actually tranmit on (bands); even if the ATAS-1 or -2 are selected?..

Dave,

I yes I knew that but I'm always wishing that maybe just maybe Moto.
made a low bander for some spcl govt. group, although I know it'll never
come to be I still need to check all of the spectras that I see at the
hamfests just in case.

Mike

# 12164. Re: [FT100] Fried Finals

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-08 22:45:04 UTC
From: Mike May
Topic: 12164  Message: 12164

Probably not since mine has the fan mods and stays very cool in rx and my finals died when I was in rx. Here is the schenario, the car was sitting in the parking lot for 8 hours at about 50 F so no heat problems, I got in the car and started the engine and headed home from work and turned the radio on and monitored the local PD in VHF high band. About 5 minutes into the drive home I smelt burning silicon and the radio was still receiving fine. I felt the side of the radio and it burnt my hand so I turned it off and headed home. Put it on the bench and rx worked fine sensitivity was great all bands only problem was it was drawing a constant 12 amps no matter what band or mode so heat doesn't seem to be a problem in my case and the V/U power out was zero watts. I am thinking a voltage surge of some type so it looks like the 13.8 volt line may need some type of transzorb surge suppressor, mine has it now.

From: k5unm
Topic: 12165  Message: 12165

Well finally heard from YAESU on my FT100 (second time for same failure mode) total bill is $355.41(USD) which reflects $255.00 for the output V/U module and the rest labor and shipping. Which means for what it is worth 1 hour of tech time 75.00 and 10.00 in shipping leaving 15.00 for chip capacitors. Plus all modifications to get it to latest configuration was free. Guess I'll pay the tab and keep on trucking since no other radio out there is as small and usefull as the FT100 with either the ATAS100 or HighSierra HS1500.

And mine did the same thing on receive. I reported that on this forum a year or so back. My unit was only about 3 weeks old when it caught fire in the receive mode!!! Yaesu tried to say there was something wrong with my power supply or other. No admittance of any internal problem with oscillation or other. They did replace the final amplifier board I believe which has the finals.

Please respond
to FT100

Hi John,

mine bit the dust while in receive, I was not tasnsmitting at all but listening to the local PD on 154 MHz when I smelled something overheating'. I felt the side of the radio and it litteraly burnt my hand so I turned it off and headed for home. I got home and put the radio on the bench supply and found it drawing 12 amp in receive in all bands and modes under any condition. It wasn't stuck in transmit either as it was still receiving fine but just drawing 12 amps all of the time and that's when I suspected the VHF final. Sure enough it was shorted drains to gates. So I guess it's a toss up as to under what conditions it could happen.

From: robert blumenkranz
Topic: 12048  Message: 12168

Try to get another ham with an ATAS that works well on
10 and 6 to screw into your mount and see if you have
the same problems. There can be some problems with the
ATAS that can cause swr dips to be passed over when
resonating with commands from the radio. To verify the
performance of your ground you can use an MFJ SWR
analyzer and set your antenna to minimum length and
see if you get a good dip on the swr around 50 mhz.
The ground needs to be right at the base of the
antenna. A copper strap may not be a good ground. You
can also try moving the ATAS to another grounded
surface to test it out.

# 12169. FT-100 setup in my Jeep Grand .

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-09 13:55:03 UTC
From: Albert Furlow
Topic: 12169  Message: 12169

Hello all,
I have mounted my FT-100 in the back, with the fans facing up, because the fans suck air out, why not help the natural flow. This also helps me to get to the plugs, and use PKS31 while parked some where.
The radio is mounted in a metal framed box, with wood covering the openings. This covers it from the sun, heat, and bad guys. It is not air tight at all. There are several large opening on the sides to let air in. Right next to it I have my FT-8100. I have did the mods, all two of them and it works great, no heat or swr, just pure magic. I am going to try to post some pics today.
On the ground subject, the box is screwed in to the truck in four places, and the FT-100/FT-8100 are them strapped strait to the box, and to the contact points of the truck. My DK3z antenna has three points of ground also. Hope this helps someone.

>signals? Yes, it is; when the vehicle is shut off you hear stuff much
>better. The FT-100 NB is disabled in FM!

I agree. I spoke to a Tech at Yaesu Cerritos about this issue and his position was that you don't need a noise blanker on FM because you can't hear the noise. I took him out to my car and had him listen to a local 2 meter simplex QSO from an HT to the control operator at W6RO.

While we were listening, a delivery truck pulled into the parking lot and the HT side of the QSO (which was about an S-6 with my motor off) disappeared due to the S-9 ignition noise from the delivery truck that was stopped about 15 feet from my vehicle.

I said "Hey, you're right, I can't hear the noise, but what about the QSO I was listening to?" He had a funny look on his face as he went back inside, without ever admitting there was a problem. Fortunately for me, I rarely use FM and the SSB side of the rig works FB... so I guess that if I had to say there was a flaw with the rig, this would be it.

But other than this design shortcoming, the rig has been a super radio. I have the original non-D model and it has worked perfectly for the last 2 years it has been in my Chevy Blazer. And to this day, I am still amazed at how well the ATAS antenna works considering it's small size.

# 12172. Re: [FT100] ATAS 100 HELP

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-09 19:26:15 UTC
From: lhlousek
Topic: 12146  Message: 12172

I've tried my ATAS in my shack and it was FB 40 thru 2 meters. I use 2 or 3 radials made from ribbon cable. Each ribbon cable radial has a wire cut to 1/4 wave for each band I intend to use. The radials work on odd harmonics so the 40 meter radial is good for 15 meters too. Each of the ribbon cable wires is separated from the others wires for the last 1/2 of its length. The radials are strung out around the house. You can zig-zag them and bend them around but it is best to keep the ends of the radials as far as possible from the antenna. (When storing them, wind them in a figure eight over your outstretched thumb and pinky starting from the common end and they won't get tangled.)

I also put a choke balun on the feedline at the antenna so that the feedline and rig don't act like a radial. This prevents RF on the rig.

This same setup works with the MP-1, HamSticks, etc.

As far as the ATAS on a vehicle. The base needs to be electrically connected as directly as possible to the metal surrounding the antenna. If the antenna mounted on a lip mount that means the door or hood and the fender all need to be connected together with short low impedance connections. If it's bumper mounted, you may need to connect the bumper to the sheetmetal of the car with short low impedance straps as close as possible to where the antenna is mounted. Some people have had good results adding 1/4 wave counterpoises zig-zagged under the vehicle for the lower bands (40, 30 and maybe 20 meters).

==========

Yes, FM is not immune from noise in the channel. The amount of 'capture' is a direct function of the ratio of the RF signal bandwidth to the audio bandwidth. Recall that broadcast FM uses a deviation of 75 kHz, but for VHF/UHF 2-way we use 5 kHz deviation. There is not that much "improvement". Commercially, for example, on "low band" (e.g. 6-meters) the MSTR-II GE rigs used an optional noise blanker to improve weak signal reception, but that is not at all common. "Low Band" is the area of the spectrum where unfiltered raw ignition noise is the strongest. Automotive practice is to sufficiently filter the Broadcast FM band so that with their 75 kHz deviation the noise is not obvious to most customers. Ditto for the AM broadcast band.

There are the other sources of "noise", principally the fuel pumps. One of the most irritating spurious "noises" that I have had was in an Audi with a clock that blanked out the local repeater on 146.820 MHz. I understand that its proletariat brother, the VW, had a similar problem. And then there was the one commercial 2-way customer that came in with a brand new GM truck whose computer radiated a huge signal right on the frequency he used in his business. He turned it in and bought a Ford.

The automotive engineers know how make noises in a vehicle imperceptible down through the HF spectrum, but the customers have not made any noises that management has heard. Those words I heard having dinner one day in Washington with the head of "EMC" (Electromagnetic Compatibility) for one of the big-3. 'Pres' is so right.

I don't know the full extent of the other side of the coin: radiation into the car's workings. The first serious situation of which I was aware was a Lincoln that would apply its brakes "randomly". The customer identified the problem by happening to see an adjacent taxicab driver lift his mike and when he pressed the mike button the Lincoln went into braking. [Yes, Lincoln fixed that problem promptly]. Interestingly, the customer went after GE on that one, originally. About 1960's or so I took out one of the lab fleet new Dodge cars for a trip up the Thruway. I stuck my 10-watt Drake 2-meter rig in the cigarette lighter "outlet", and had a fine Larsen 5/8ths magmount on the roof. Every time I pressed the mike button, I would drop out of Cruise Control. And then the Cruise Control no longer worked. A Dodge service manager I was chatting with after that said if I was lucky, the fuse blew, but sometimes it did not and blew the solid state drivers for the cruise control.

Recall that Federal DOT backed off on mandatory ABS for over the road trucks? Unknown random failures bugged them. The problem was found to be RF from nearby FM stations.

FM
> >signals? Yes, it is; when the vehicle is shut off you hear stuff much
> >better. The FT-100 NB is disabled in FM!
>
> I agree. I spoke to a Tech at Yaesu Cerritos about this issue and his
position was that you don't need a noise blanker on FM because you can't
hear the noise. I took him out to my car and had him listen to a local 2
meter simplex QSO from an HT to the control operator at W6RO.
>
> While we were listening, a delivery truck pulled into the parking lot and
the HT side of the QSO (which was about an S-6 with my motor off)
disappeared due to the S-9 ignition noise from the delivery truck that was
stopped about 15 feet from my vehicle.
>
> I said "Hey, you're right, I can't hear the noise, but what about the QSO
I was listening to?" He had a funny look on his face as he went back
inside, without ever admitting there was a problem. Fortunately for me, I
rarely use FM and the SSB side of the rig works FB... so I guess that if I
had to say there was a flaw with the rig, this would be it.
>
> But other than this design shortcoming, the rig has been a super radio. I
have the original non-D model and it has worked perfectly for the last 2
years it has been in my Chevy Blazer. And to this day, I am still amazed at
how well the ATAS antenna works considering it's small size.

# 12175. Adapting the Radio Shack FIVE DOLLAR Simplex Repater to mobile use

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-10 01:53:18 UTC
From: Pres Waterman
Topic: 12175  Message: 12175

Step-by-step modification instructions for the Radio Shack 19-345 simplex repeater
for use with the FT-100/FT-90 which have discrete ( and multiplexed ) PTT lines

UNHAPPY DEVELOPMENT: The FT-100 does not work well, I think in "beta 3" I will try an optoisolator for PTT

BUT the FT90 works well and I am going skiing with it tomorrow!

Caution: this project involves Surface Mount Devices, and soldering tiny wires directly to them at the point where they meet the PCB. Please do not contact me for advice beyond what is given here. These steps worked for me. There are NO schematics and no pictures of my project available. Just use these steps and make it up as you go along! I did...

Intro: The Radio Shack simplex repeater, currently closeout/blow-out priced at USD$4.97, is a dandy deal. It is used to hook up to an HT whose mic input also causes PTT ( transmit ). Why would you want one, you say? Well, besides boosting range between handhelds without using a "real" repeater there's propagation/antenna testing, audio checks, and in general goofing around. But it would be nice to use it with a higher power mobile such as the FT-90 or FT-100, or a base rig. But, alas, the mobiles and bases typically use a contact closure to ground separately from the mic line. Here's where the mod comes in. Try to score several of these little dandies to screw up your first one and have 2 spares!

( receive signal valid is internal VOX in the repeater so it's quite simple to use )

Items needed:
19-345 repeater ( Did I mention it's only FIVE BUCKS? )
6-pin modular RJ-12 plug with all 6 wires present and a cable
a single wire with mini-phone 1/8" or 3.5mm mono plug ( must be skinny enough to fit into the speaker socket on the FT-90 which is recessed )
a nice option: two color, 3 lead red/green lead with common ANODE and a 470ohm resistor
100kohm resistor for PTT pull-up
1kohm trimpot for audio control to radio

1) remove the repeater from the case- there is a hidden screw under the sticker on top! Also one attaching the PCB.

2) remove the battery contacts after noting +/- on the PCB with a permanent marker- discard them

3) BONUS STEP: remove the green LED which only indicates receive signal present. Replace it with a 3-LEAD 2-color LED, with green hooked up as before. I used Radio Shack 276-207 Bi-Color LED which is kick-butt bright and big. When you have put in the new LED you will have an unconnected wire for the red element. Hook that through a 470ohm resistor via a flexible wire ( like ribbon cable stuff ) to the middle contact of the tiny three-lead SMT transistor marked 433 which is by the stereo mini socket. That is, by the way, the PTT output and we will be hooking to it later. The LED will be left on the unpopulated side of the board. Or you may want to flip it. The "red" lead connects via a 470ohm which runs across the board, through the hole between the 2 jacks, and over to the SMT transistor, so a spaghetti tube is called for. Also, insulate the connection between the "red" lead and the resistor, because if that point shorts to ground you will bypass a current limiting resistor and harm ( at least ) the LED.

4) Get a 6 conductor cable with RJ-12 ( NOT RJ-11 ) fully populated modular plug. Looks exactly like a phone cord, but 6 pins, not 4. Get to know the colors. Looking into the body of the plug, as if you were about to plug it into the jack, left to right with the latch down:

pin 6: PTT ( and ACC and UP and DOWN )
pin 5: Mic audio in
pin 4: Ground
pin 3: +9v
pin 2: ignore ( packet audio out on the FT-90 ) ( shame it's not squelched-would eliminate the speaker lead )
pin 1: other switches we don't need, ignore

So, we are interested in four of these, plus a connection to the speaker socket. Remember the colors for each.

IF you decide to hack up the very long mic extension cable for the FT-100 separation kit, and you feel you CAN reattach a new RJ-12 plug to the cable, the colors are: shield=ground; black <yup!>=+9v; yellow=PTT; white=mic to radio

To tell the truth, I found the wire inside that cable to be between difficult to impossible to solder, I would try other stuff. My prototype used CAT5 network cable but it's rather stiff.

5) Run the 2 cables ( mic and a single wire for speaker ) through a PCB hole and secure them, using plastic wire wraps or whatever else method makes sense to you

6) connect the speaker lead by tack-soldering to the stereo submini socket on the PCB at the outermost contact not counting the ground connection. Beep it out with the original cable if not sure.

7) connect +9v and the ground braid to the areas where the battery contacts were. At this point, plug it in and check for a flash of green when plugged, and that opening the squelch triggers the green LED.

8) Connect the mic lead to ( watch carefully the description ) the tiny SMT resistor by the stereo socket, that has continuity to the original "Y" cable's submini 2.5mm or 3/32" tip when the "Y" cable is plugged in. Oh Jeez, read that twice. You are trying to connect to the same place the "Y" cable was connected to, except on the board.

8A) Unlike FT100, FT90 users have no mic gain menu. The output of this simplex repeater is HOT even when the input is set right. There's a lot of hiss due to excessive mic sensitivity also. So I also tack soldered a 1k-ohm trimpot glued to the PCB. One leg to ground, the opposite lead TO the radio, the middle to the simplex repeater output as mentioned in 8)

9) PTT goes to the point mentioned in "bonus' step 3. ALSO a 100k-ohm pull up resistor MUST go to +5v. I got it from the center anode lead of the LED.

Adjustment steps:

A) After plugging in the speaker, plug in the cord to the radio. Observe the green light flash and the red light glow. For some reason, the red LED glows medium strength in standby, plus green in RX, and bright red in TX. I don't know why, but I like it!

B) volume down, carrier mode, squelch open, advance the volume just until the green receive light glows, then close the squelch.

C) Speak and hear yourself repeated, low and hissy. Advance the volume until you are robust, or until no further volume increase is noted, and then back off.

D) open the squelch and record up to 30 seconds of white noise. Bring down the mic gain in FT-100 menu or the 1k-ohm pot on the FT90 until it begins to "back off". At this point you should sound full but not overdriven, without hiss in the background. I actually have it sounding pretty darn good.

E) play with various volume and mic gain scenarios.

FT90 bug: since the PTT is multiplexed with the "ACC" and UP and DN buttons, sometimes, despite the pull-up resistor, the radio switches between the 2 "home" channels as you are plugging it in. I suggest you use the UHF or VHF "home" channel and if it toggles them keep plugging it in until it settles on the intended band. Sorry, this is beta testing and I haven't knocked this. The 100k SHOULD have solved it by holding the PTT line at 5v until PTT is called for.

Simplex repeater characteristic: it is rated to notice signal within 2 seconds. Typically it is faster. IF you have the volume just high enough it will probably open right away. But you and your users might have to "Aaaaaaah" before talking, or wait, and you will quickly get used to what is necessary, especially since you have instant feedback!

You do not need coordination for this operation. Just be sensible. Don't set up on a high hill in carrier on the national calling frequency. BTW: I highly recommend you use tone squelch or even DCS... and you CAN use a "repeater pair" on the simplex repeater radio... that way users don't hear

each other as they speak before they are repeated. Only themselves repeated. With a cool little beep when they are done! ( 30 seconds capacity BTW ). Identify the repeater as it is a separate transmitter ( like "This is W2PW on W2PW repeater"... and only one of you have to do it. Maintain control: local, wireline, 222+MHz link, you know the drill.

# 12176. new mods?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-10 02:22:32 UTC
From: Pres Waterman
Topic: 12176  Message: 12176

Here's a new one on me...

Today, after weeks of successful mobile operation, I noticed the radio would fail to TX on 40m even though it found a good SWR. The display would blink, flash, say "ERR", stuff like that. After checking the obvious loose grounds ( the car had just been washed too ) I decided to take the radio inside and check to see that the SWR mods, if done ( couldn't recall ) were still tight.

Imagine my surprise when I opened the radio, found a tiny strap screwed to the frame all nice and tight, but also copper tape applied to both top and bottom covers! Along the back edges, along the middle, and some tiny bits on the little flaps that hold the cover down in front! Very purposefully placed, just taped there, connected to nothing.

Also I noticed a lot of black blobs ( ferrite chokes??? ) encased in a felt tape wrapped around various coaxes, and even the CAT pigtail.

The only thing I know is the radio was sent in a few months back for a Customer Pay repair and we asked them to check for updates too.

I have a 97 for Ford Explorer and wonder if anybody has a good suggestion for a good mounting location and method for the FT100. I'd like to put in under the dash on the drivers side but there really isn't enough room. Won't fit under either of the front seats. Under the rear seat would work but then I couldn't fold down the seat. In the center console under the armrest would be OK but I'd have to come up with some way to ventilate the space, maybe with an auxiliary fan. Any suggestions?

Construct a wooden mount to fit over the console (over the cup holder). Finish the inside portion that will face the console with a remnent of rug from a store. This should secure and pad the console from wear. Place the mobile mount on this frame and enjoy. I have an Explorer and you'll be hard pressed to mount it anywear as well as snake in the cables. Please be careful, every nook and cranny have something under or behind them.

Topic: 12180  Message: 12180

Hi

I am interested in hooking up a soundcard to the Sharp's Wizard OZ-770 or 730 for operation in PSK31.

I need to learn Basic and I found a really cool program that would be an assembler, compiler, etc. And allow me to sell my programs. Found at www.programfiles.com

The OZ-730/770 has an I/O port for uploading/downloading programs to the organizer and the CPU via a software interface. I have read emails on the webboard at www.mywizard.com, concerning a ham hooking his organizer up to a packet modem. He used 'WizTerm.wzd' (Wizard Terminal Email Program). You will have to search the internet by typing in "WizTerm".

So I want to convert or ask someone to compile Digipan back into the language, Basic.

I basically need a small board with a substitute mini-soundcard on it. Maybe I can get one out of a throw-away laptop.

Daniel

Get the separation kit. Put the head at the top of the windshield, under the visor.

Prez Wrote:

>700,000 US hams
>70% active
>40% active mobile

You assume that all 40% of the mobilers are worried
about ignition noise? Frankly, In my experience, the
only people worried about ignition noise are HF types.
FMers, like me, usually don't worry about ignition noise
as FM is fairly immune from ignition noise. Those I
know that have it usually can knock it out with a filter
in the power line. This is not easily done with the HF
rigs pulling 20 amps.

I think you'll find the HF mobiler percentage much less
than 10%. at 10% of the active hams worried about
ignition noise, that breaks down to 61 cars / car type.
Not enough to make a manufacturer change design.

We are fast to say that interception of unwanted radio
signals on TVs, etc is the fault of the receiver, yet,
our receivers can't take spurious emissions either.
Sounds hypocritical to me

Pres,
I have your spare FT100 you sold last year. It works perfectly. It has the correct factory SWR mod and ALSO the copper straps you mention in exactly the same spots. It seemed to me a bit optimistic that that copper tape was making a good connection to the case.

So, I spot soldered the "tape" to make sure there was a good electrical connection. Even on the little tabs. Do this at your own peril, though. The heat from the solder station changed the gloss of the grey paint on the showing side. It is probably only noticable to me but it is there.

Date: 2002-02-10 10:16:41 UTC
From: Jesse
Topic: 12141  Message: 12184

I have my 100 with VHF/UHF ant. on it. But I have a 8500 as the primary running APRS on VHF and voice mostly on UHF. Then if I want to listen to the VHF also I just turn on the 100.. But mostly for HF.

Prez Wrote:

>700,000 US hams
>70% active
>40% active mobile

You assume that all 40% of the mobilers are worried about ignition noise? Frankly, In my experience, the only people worried about ignition noise are HF types. FMers, like me, usually don't worry about ignition noise as FM is fairly immune from ignition noise. Those I know that have it usually can knock it out with a filter in the power line. This is not easily done with the HF rigs pulling 20 amps.

I think you'll find the HF mobiler percentage much less than 10%. at 10% of the active hams worried about ignition noise, that breaks down to 61 cars / car type. Not enough to make a manufacturer change design.

We are fast to say that interception of unwanted radio signals on TVs, etc is the fault of the receiver, yet, our receivers can't take spurious emissions either. Sounds hypocritical to me

Pres,

Where do you put the rest of the radio? I only see half the solution. I have an Explorer ( good vehicle by the way), mounting locations are hard to find.

Get the separation kit. Put the head at the top of the windshield, under the visor.

I posted this back in January in response to the same question:

"Declared Value" is what they state as the value of the item to the shipper for insurance purposes. "AM Repair" (I'm quite certain) refers to Amateur Repair (as opposed to Commercial Land Mobile?). I've interpreted this to be their labor cost at the "Amateur Repair" rate. Any better information out here?

# 12188. PDF Manual and Acrobat Reader 3

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-10 16:23:23 UTC
From: John Hirth
Topic: 12188  Message: 12188

I'm happy to report to the group that the PDF file of the FT-100D Manual can be read successfully using old Acrobat Reader version 3.01.

I was able to find a copy of the old installation file for 32 bit systems on Adobe's FTP site and installed the stand-alone 3.01 reader on my Win Me system. It opens and reads the PDF Manual file just fine, and all of the Bookmarks work as intended. Print works fine too.

This says nothing about the even older 16 bit version of Reader 3.0 intended for use under Windows 3.1, but we have to make some assumptions about how far back we should go to strive for universality, right?

73,
John W2KI

Hi Lou.....I have the seperation kit installed and run the head to the front where I mount it on a pedestal stand. The stand is made by Portagrip (Stay-put Flex Mount) and is available from HRO (page 75 in catalogue). Attach the base of the mount to the bolt attaching the "shotgun" seat to the frame. I found a nice piece of walnut that I finished and attached to the top of the mount to afix the head to (with velcro). I have this set up in a new 4Runner, but previously had it set up in an Explorer.....Good Luck, Paul KD5KCZ

Topic: 12178  Message: 12190

Lou,
Mine is remote mounted on my 98 Explorer. The control head is mounted at the top of the dash board just above the air-vents. I used double stick tape and fashioned a metal bracket. It is a great position as you don't have to look down or move your head much to see it and it is an easy reach. Both are handy for trying to drive and operate. Because it is mounted towards the top of the dash I take care to make sure I have sun screen in the window during the summer when I am parked.

The radio is mounted in the cargo bay in the side panel on the driver's side. (Same place the jack is stored). It is mounted on top of the wheel well on some foam to give it some vibration protection. There is a cable channel that runs from the front to the back along the floorboards.

I've been running this combination for going on three years and put lots of miles on the unit and the only problem I have had was having my ATAS100 go bad to be replaced with a full size screwdriver - BIG IMPROVEMENT.

I only operate HF CW and I got the FT100D because of it's superior specs in that regard. I've used 2 meters and a repeater just once, to see if the rig worked on 2 meters.

I do wish the user interface was better. Having to turn off BKN and the keyer and hold the paddle to generate a spot note is a real pain, and then you have to go into the menu system just to change keyer speed. On that basis alone I came very close to returning it and trading up to a TSB2000 but I didn't want the added expense ($350) and bigger box although I gotta admit, for that $350 more you get a heck of a lot more rig.

With the same number of buttons and basic interface design they could have done a much much better job of the UI.

I use my FT100 for 10mtr AM mostly with a little 10mtr
SSB for European early morning DX.

Recently I've also been doing a lot of 17 mtr SSB
mobile. Great band it!

No FM !

From: lhlousek
Topic: 12178  Message: 12193

OK you guys, I have no problem figuring out what to do with the head. I plan on mounting the head (and paddles), one way or another, just off the end of the center arm rest so I can easily twirl the VFO and operate the rig as I drive. It's the box I can't find a good spot for which is surprising considering how small it is. Keeping them joined and mounting the whole rig over the center console isn't a bad idea but I was hoping for something a little cleaner. It looks to be possible to mount the box where I originally had hoped to, below the driver's side dash, but it's going to be tight and rigging up a mount is going to be tricky. I'll keep pondering my options.

# 12194. Re: [FT100] new mods?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-10 19:23:06 UTC
From: The Simpsons
Topic: 12176  Message: 12194

I had the same problem, intermittently, with my installation. If I tuned on 14MHz or above, operation was quite stable. On 7MHz though, the tuner (SG-239) would give a good match but as soon as I went to SSB, the SWR icon would come on, the SWR was very high, then the radio display would flash and the ERR icon come on. I added an earth strap from the case of the FT100 to a seat mounting bolt. The FT100 is under the drivers seat. I had not needed the strap before this. The problem was traced to poor earth connections between the base of the antenna and the anyenna mount. Also poor earth between the mount and the body of the vehicle. My mount is home made and bolted to the back door spare wheel carrier of my Isuzu Trooper with a piece of pipe formed to follow the door frame on the hinged side so the antenna is mounted at roof height. Doing a decent job of scraping the paint off of all mounting points and at the antenna base meant it now works ok without the earth strap at the radio. I've left the strap on at the radio though for extra safety in the future.
The earth strap at the radio was not needed on my previous vehicle, or when I first installed in the Isuzu. The earth at the antenna measured very low with a meter, but I suspect the current at full power caused problems. The impedance at the base of a mobile antenna can be very low.
I did the SWR mods myself some months ago, and also added the resistor for the cooling fans. I did notice a number of the black felt blobs when I had the radio apart for the mods, but no copper tape on the case as Pres mentioned. I have seen this tape used on other equipment in this way to ensure a good contact between the case and frame of a radio.
This is the first (and only) problem I've had with my FT100 and have owned it since September, 2000. I don't think I can blame the FT100 for it though, just my poor installation practises and too good a paint job on the antenna mount!

Grant, ZL2BK.

Lou,

I use my FT-100D also for HF CW mobile. I have a couple of suggestions.

To spot a station, press the DSP button, then DBP. This will narrow the receive passband enough for you to spot (tune) the other CW station. I use the 240 width, but, you could use the 60 if you really want to narrow it down. If you then want the wider filtering to operate, hit the DBP button again and you are in business...quick and easy.

I leave MENU #52, Keyer Speed in the FUNC button. If I need to change speeds on the fly, press and hold FUNC until Keyer Speed pops up, turn the main dial until you have the speed you want, then press FUNC again quickly and you are all set.

Hi Mark,

Thanks for the info. I considered putting the box back there but the rear windshield washer reservoir and an electric module of some sort is back there on my Explorer and there doesn't look to be enough room. Where is the cable channel that runs from front to back? My ATAS will be mounted on the front left fender so I'd have to run the power and feedline back there and then the mike, key line, head and speaker cables back up front.

<<Under the front seat?>>

No dice. There is zero room under the front (power) seats of my Explorer. You can't even get you hand under there to fish out an errant french fry or potato chip.

Hi Grant,

Call me old fashioned but I like to zero beat to within a 5 or 10 Hz using the spot function. Also, I put my FT100D audio output on a spectrum analyzer and the 120 and 60 Hz DSP settings are not significantly narrower than the 240 Hz setting. They just attenuate the sig more.

You can leave the menu on 52 (keyer speed) but if, for instance, you go to DSP BPF and hold BPF to get into the menu to change to a narrower setting and then later use the func button to go to the menu, the menu is still on DPF instead of keyer speed, where you left it. This is an example of where they could have easily designed a better UI. Why not have the menu item, as accessed by holding the func key, stay the same after you access the menu via holding one of the A, B, C or D keys to change their parameters? How about making what's available in the menu and on the function buttons mode-dependent so you don't have to scroll through settings that are totally irrelevant to the current operating mode? And, how about making holding the KYR button get you to the keyer speed instead of the keyer type?

It's not that it's impossible to use but that it could have been so much better with very little effort on Yaesu's part. It's like is was designed by an engineer that never operated a radio. That's what is frustrating.

I have a 98 Exploder, I mounted my FT-100D on a flexible stalk that is screwed into the floor just to the right of the center console. I mounted the unit without a separation kit to allow quick removal. The flexible stalk allows access to the storage cubby holes on the console, and proper positioning of the rig. The whole Idea of where to mount a mobile HF rig is to allow easy eyes off use while mobile. I can tune around the HFbands with my right hand, arm resting comfortably on the center console. I could post some pictures , if anyone need's a visual reference.

Until last year I had a 1992 Explorer and now have a new 4Runner. In both vehicles, I mounted the head in front as described earlier and mounted the main unit in a fishing tackle box, which fits snugly on the transmission hump on the floor of the back seat area. The tackle box (heavy plastic) will give the transceiver plenty of physical protection. The back of the box is lodged against the back seat, while the front of the box fits firmly against the back of the middle console. Finding a tackle box that accommodates the transceiver and also fits properly in the space described took some time. Roughly, the box is 12" (length) x 6 1/2" width x 8" height. I actually mounted the transceiver on its mobile bracket then fitted all into the bottom of the tackle box on a 1x6□ board. This is important, as there are vent holes on the bottom of the unit. I made several 1 1/2" ventilation holes and glued nylon window screening over each hole. Also I positioned the vent fans on the transceiver directly on a vent hole in the box. This was for good ventilation and I added a CPU fan inside of the box as well, which vents through a whole in the top of the box. You can adjust the speed of the fan with a resistor in its power lead and a power switch for the fan is a good idea.

The tackle box can be placed anywhere in the vehicle and in fact makes the rig portable as well. The tackle box might also camouflage the unit from theft. This works well for me and I hope it will be of some use to the group.

Mount it in a tackle/tool box? That's and interesting and seemingly obvious idea I hadn't thought of. Good ideas on ventilation too. I could stuff it under the rear seat and pull it out if I needed to fold the seat down.

I wish you luck. I don't believe putting it under the drivers side is a good idea. It's bound to get in the way and if you have an accident you'll get injured. I tore apart my Explorer trying to find a good position. Taking apart the glove box revealed electronic pods located behind it and the air bag above. Taking off the black key rest above the change holder revealed that it would not even fit there--no place to put the mount. Under the seats--well you know that route. Another problem is snaking in the wires from the battery. There is no easy access to the firewall. PLEASE-if you drill a hole be careful--there are modules all over the place. If you choose to come up from the floor--be sure to seal the hole with a grommet to prevent rubbing of the wires and water penetration. Because of this I decided not to install it--but that's me. Good luck

Gentlemen.....I think Jeff and I have the same idea. In my installation I have mounted the head on a pedestal stand. The stand is made by Portagrip (Stay-put Flex Mount) and is available from HRO (page 75 in catalogue). I tried a similar stand made for mounting portable CD players in cars, but it was not stout enough.

Attach the base of the mount to the bolt attaching the "shotgun" seat to the frame. I found a nice piece of walnut that I finished and attached to the top of the mount to afix the head to (with velcro). Paul KD5KCZ

From: lhlousek
Topic: 12178  Message: 12206

In my Explorer there are two big rubber boots that go through the firewall and are easy to access from both sides, one around the steering column and the other around the shifter cable (automatic with column shifter). It will be very easy to poke a hole in either or both boots to run the power wires and antenna feedline.

I did find the troughs for running wires between the front and rear of the vehicle. They are under the trim panels at the bottom of the door thresholds. The problem is they are already occupied by wires and it might not be good to run the feedline and power cables parallel to the existing wires. I could put a braid shield over the power wires and maybe an additional one over the feedline and ground it at both ends of the trough. Alternatively I could just run the wires underneath the vehicle and find or drill holes into the passenger compartment in the rear.

As for the box being in the way or causing injury, I doubt it. It will be up under the dash flush with its lower edge. I had it wedged in there and it was completely out of the way. Still....it'd be problematic fabricating some kind of odd shaped bracket and getting it stuffed in there.

So, most likely option now is in a box stuffed under the rear seats.

No need to drill a hole.
There is a very large grommet that feed a small cable through the
firewall. It has a good inch or so one each side that you can simply
poke a hole in to feed the power cable through. Just remember to fuse
it at the battery with a fuse for both the positive and negative sides.

Lou,
My 98 does not have the reservoir there and there was plenty of room for
the radio.
If you are going to mount the ATAS in the front I would not recommend
mounting the radio in the back. With the ATAS100 you want to keep the
coax short. The tackle box idea really sounds good to me.

Try again, except consider the rear portion of "under the front seat"...
Inage kids in the back seat tapping their toes on the box.

I have done it in many Fords. Currently the Escape XLT with power seats.

However, I found there is a heater output under there so I removed it and
relocated it to the rear cargo area, on the left panel, there is a net to
hold it and everything.

I don't know if you have the newer body style or not, but I managed to mount a large CD changer (back in my audiophile days) between the back seat and the side wall of my '93 Explorer Sport. Of course, they may have drastically changed since then.

OK you guys, I have no problem figuring out what to do with the head. I plan on mounting the head (and paddles), one way or another, just off the end of the center arm rest so I can easily twirl the VFO and operate the rig as I drive. It's the box I can't find a good spot for which is surprising considering how small it is. Keeping them joined and mounting the whole rig over the center console isn't a bad idea but I was hoping for something a little cleaner. It looks to be possible to mount the box where I originally had hoped to, below the driver's side dash, but it's going to be tight and rigging up a mount is going to be tricky. I'll keep pondering my options.

Works fine on my FT100. Just be very careful when performing the reset
song and dance. Follow the
instructions exactly, or the mod won't work.

Hi Lou,

You've got a bunch of suggestions here - I didn't read them all - but I have a 4 door 97 Explorer XLT. If you have the same type - consider doing what I did... I located the remote head mount in the upper cubby hole of the dash - supporting it from the top of the cubby hole (remove the cubby hole ass'y for ease of install). It fits nicely there. The radio itself was harder to do - but I found that removing the carpet clip from the fold down driver's side rear seat / rear floor allowed me to drill the steel plate to mount the radio to it. This allowed for air circulation in the space when the seat is or down. Just lay it all out so that it fits when the seat is down. You'll find it is undetectable and complete safe from harm if you take the time to lay it out completely. I did however find that I needed to lay a 2"x4"x12" between the seat and the plate so that the plate didn't press the radio into the seatback - but rather rested on the 2x4. I have uploaded pics of the radio mounting.

What is 2mtr fm? Is this some new kind of mode like PSK31 or
something?

Just kidding.

My FT-100 has never been tuned to any frequency higher than 6 meters
and has never transmitted on any frequency higher the 10 meters. I
do not even have an antenna connected to the UHF/VHF connector.
Maybe I ought to build an antenna and try out this "new mode"

I do have a second 2 meter/440 radio in my vehicle that I turn on
occasionally. Usually this is to listen to the National Weather
Service on 162mhz. The FT-100 is always on and tuned to HF whenever
the ignition switch is turned on in my Blazer.

Why would anyone buy an FT-100 and only use it on UHF/VHF. Isn't
that like buying an Greyhound Bus and only using the back seat?

I have one that I just bought -- literally -- less than a month ago. It has the AM filter installed by AES. I was going to set it up as a mobile for travel, but plans have changed. I paid $819.00 plus $140.00 for the filter installed, for a total of $959.00 plus shipping. I would take $815.00 for it, shipped within the USofA (I figure $800.00 plus $15.00 shipping). It is literally like new because it is new.

# 12221. FT-100 Manual

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 07:05:37 UTC
From: ve7baq
Topic: 12045  Message: 12221

I downloaded the FT-100 pages from Daniel's web page and saved them to a separate directory as he suggested. Now to put them to the best use!
I inserted them into my wordprocessor and then printed them but with a difference. I printed them with my wordprocessor (WordPerfect) with the pages in landscape format. This allows me to insert two manual page images on one sheet. I then save each page under a convenient file name (such as Page 2&3, Page 4&5) etc.
The front cover and the Contents and Specifications were each saved on a page by themselves with appropriate filenames.
When I print, I turn the paper over and print the next two images on the other side but I rotate the paper so that when I look at them I have four booklet pages on one sheet of paper. (Print on both sides of the paper). This allows me to print the whole booklet using only around twenty-eight sheets of paper.
I then place them in plastic sheet holder and keep them in a loose leaf binder. The front cover page is inserted in a clear pocket on the front of the binder so it identifies the book. And the inside sheets are mounted in so that when the book is open, I can view four booklet images at a time without turning it around. (Just like a flip chart). The plastic sheets keep them from tearing at the ring binder holes and also helps keep them clean.
I also included a few extra plastic sheet holders at the end of the binder for keeping any mods, notes etc., so now I have a complete manual to take with me when we go vacationing etc., in our trailer and the original is safe at home. Like many others have said, the manual can get very dog-eared after a while and this will help. By the way, the manuals for the FT-100 and the FT-100D are almost identical, so this is a great way to store it.
Thank you all for all the work to not only put the manual on the web this way but also the other one in PDF format. They are a great convenience.

Good Morning,
I am wondering if you could put the RF deck under back seat and using the remote kit mount the head, mic, and speaker in spots easy to access spots? I use mine as a slip seated rig. The RF deck is on a hump mount and the remoted on a bracket I bent out of flat steel that located right above the rear view mirrior so to make any adjustments I do not have to take my eyes off the road.

Just posted 3 pics to the 97 explorer installation pic area. Ft-100 is on stalk I picked up several years ago at local stereo shop. Mic mount and D-700 mount's simply slide into the cracks between the dash components. I have a keyboard attached to the D-700 running APRS. I can log my mobile DX contacts by sending an APRS message containing the contact info to my home APRS station. When I get home I then enter them in my main log. I used stanless screws to attach the mount to the side if the transmission hump. When you put the screws in , check clearences carefully. I used screws about 1.5 inches long. Power is run directly from the battery, through one of the rubber plug's in the firewall. D-700 body is just to the left of the console.

No need to drill a hole.
There is a very large grommet that feed a small cable through the
firewall. It has a good inch or so one each side that you can simply
poke a hole in to feed the power cable through. Just remember to fuse
it at the battery with a fuse for both the positive and negative sides.

I have two large grommets. A white one about 2 inches in diameter above and slightly to the left of the brake pedal. The push-pull cable for the column mounted shifter goes through it. The other one is grey, about 3" x 4", and the steering column passes through it.

The grommet I used is located under the fuse box under the hood. It is much easier found by looking at the firewall on the driver side from the inside of the vehicle. The cable that passes through it is the speedometer cable.

Hi guys,

I made a wrong assumption about the wording on the back of the Yaesu manual, about not reproducing it.

I had some email me, asking if I had gotten permission from Yaesu.. So I called up, Yaesu and asked them their opinion. I also emailed Japan, and California and asked them what they thought, even though I don't intend at all to sell it. But just the idea of putting it on my website.

The guys at Vertex Standard; to avoid any headaches from Japan; that I take it off of my website.

I know that everyone has now gotten it. And you have the choice of taking it off of your website or leaving it on. Well it was fine while it lasted.

Vertex Standard said that the reply time on messages from Japan take at least two weeks, because of their turn around.

I will now remove the link from my website.
I will still have a link to K0Lee website.

Sincerely,
Daniel

# 12231. FT100D/Astatic D-104

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 18:08:12 UTC
From: rabbit4494122
Topic: 12231  Message: 12231

Hello everyone,

Has anyone mated an Astatic D-104 using its built-in preamp and fitted with the standard 4 pin, circular connector to the FT-100D? I'm trying to make an adapter cable and have the 6 pin modular connector and the 4 pin circular male. The trouble is, I can't figure out the pin connections on either. The schematics Yaesu provides don't give me enough information. Maybe I should contact tech service. Any suggestions, however, would be appreciated. Thank you.

Mark Watanabe, KG6IBY

# 12232. Good news about the new radios (FT-100D)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 18:13:34 UTC
From: Ham_Tech@juno.com
Topic: 12232  Message: 12232

Hi guys/gals,

I just talked to a Vertex Standard rep.

I was confused about the reason of the FT-100D having mods to add.

He explained that instead of Yaesu calling the repairments the radio; "fixings" (change out components for new ones: Yaesu would call them "modifications" or "mods" (adding new components to the FT-100D board/modules.

I also asked about the Hi SWR icon problem. He said that the microprocessor was displaying a 'False' representation, and thus telling the microprosser to drop the power output. In the jist of his own words he said, "We would take the radios and open them up to find this problem to be false. Then they would call it stupid (mainly frustrations to a repeated problem) and slap it around a bit to make it work correctly (I assume that they do some reprogramming of or replacement of the chip), then send it back to the owner."

He said that after the new supply of FT-100Ds that Japan has been sending out, the calls have slowly decreased.

I asked him how I could tell that is was the latest version of the FT-100D and that it would not have anymore of these SWR problems. (Which Yaesu Japan, have been able to catch up on, in their production department, which the Rep. mentioned.)

Here is how to see if it is the latest model:

Open up the cover and look for brass fittings on the inside...of the lids and boards.

I hope that this has helped you. And to Lee Devlin, this guy thinks that you have a pretty cool site with the modification links.

Gee- do you think they would respond as quickly to a request for an updated manual that includes accurate information regarding AM operation? "Minor" points such as the fact that you need the 6 kHz filter installed would be nice. Corrections in the sections pertaining to the PROcessor function which is currently inaccurate would be helpful.

# 12234. Re: spurious oscillation design flaw in FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 18:51:54 UTC
From: backhoefade
Topic: 12232  Message: 12234

I have to respond to the guy's comment about the "microprocessor displaying a false representation". Either that statement was a lie or the guy was mis-informed. I have personally measured the spurious oscillations which occur while the SWR icon is showing up when it shouldn't. There are spurious tones at roughly 13.65 MHz and 2 times and 3 times that frequency. They are real emissions which, since the antenna generally isn't resonant at those spurious frequencies, cause a true high SWR condition, which the SWR sensing circuitry sees, as it should, and which then causes the rig to pull back on its output power, as it should. So "BS !!!" about the "display of false representation". The only "false representation" is the comment about the problem!

It's not clear precisely what causes the spurious oscillation. There has been speculation that the RF gets into the synthesizer which causes the synthesizer to output spurious signals in addition to its desired output. There has been speculation that the spurious oscillations occur in the PA section or combination of PA/Filter sections.

But the truth I wanted to bring to the group is that the spurious oscillations that result in the SWR icon are real. The SWR icon is displayed because the SWR really is high at those spurious frequencies.

# 12235. Re: Active Mobilers

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 19:08:33 UTC
From: backhoefade
Topic: 12141  Message: 12235

I found it interesting once when I read someone's message where he expressed huge dis-satisfaction with most HF rigs' noise blanker performance on AM as well as SSB. His "point" was posed in the question, "Why the heck can't the amateur gear manufacturers come up with a decent noise blanker in a $1000 rig while my cheapo AM radio in my car picks up AM broadcast stations without any ignition or other noise whatsoever!". The reason is not that the cheap car radio has a better noise blanker. For that matter it probably has a very poor noise reduction function. The difference is in the basic receive signal level and the resultant signal to interfering noise ratio. When you tune in a local AM broadcast station you're looking at a typical S9+60 or better signal level (S9+60 is a -13 dBm level; a huge level). While your typical ham signal may be around S7 which is -85 dBm. So for a given background ignition noise (or other source) level, the signal to noise ratio for the commercial station case is 72 dB greater. Go park under an overpass while listening to a relatively strong AM broadcast station in order to drop the receive signal level by a good amount and then you'll start hearing all the noise that's really there. The blanker in the FT-100D is an excellent performer.

# 12236. SWR Question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-11 18:09:09 UTC
From: box542
Topic: 12236  Message: 12236

OK, so maybe I missed something. What does the SWR icon with the O or 0(zero) mean? I get that on my FT-100 from time to time.

If it's explained in the manual, then I need to get glasses!!

Thanks in advance!!

Bruce

To all,

I was given a similar explaination of the "Hi SWR" mod
from Yaesu's Repair Supervisor. His story was that
the SWR sensing circuits were too sensitive and that
the modifications (Adding grounds and moving some
wires and ty-wraping them together) make the SWR
sensing circuits less sensitive. He insisted there is
no problem with spurious oscillations in the FT-100.

I know that's hooey, because when my FT-100 blew its
finals it was on the bench attached to a dummy load
with a frequency counter connected to the -20 dB port
on the dummy load and I was watching the counter
wander between 200 and 300 Mhz. (VHF final blew)

Common sense tell you that when you are beefing up
grounds you are working on either a ground loop or a
problem with unwanted feedback causing an oscillation.

Does he mean "brass fittings" or copper tape? I opened mine up to see what was inside. I was hoping to find a thermosister? Instead I found "copper tape" over the edges of the cover. Is this what you mean? TNX

A $800 to $1000 radio and they are worried about a $6 to $8 out of date manual for it. Strange priorities here. How much profit can Yeasu make in sales of this (out of date) and out of stock item. One would think that Yaesu would be happy that someone made a free electric copy available that saved them the production effort and expense.

I will pass along what the tech at Yaesu told me. The "SWR X" icon means that the rig is seeing a high SWR. The "SWR O" icon means that a "TUN" operation to either an ATAS-100 antenna or an FC-20 tuner completed successfully with low reflected power and it should not be seen at any other time. If anyone knows or heard anything different please pipe up and fill us in because I have no faith in the tech that told me this. He didn't know much about the FT-100 so, while I was on hold, he talked to the lead FT-100 tech and then passed the info on to me.

Topic: 12232  Message: 12245

I use my ft100 mainly as a base station.antenna is a multiband dipole fed with an open wire feedline thru a mfj tuner and 4:1 balun. Shortly after buying the radio and tuner,I had problems tuning on 10 and 12 meters.At first I thought the tuner was at fault,but after reading all the messages about high SWR and blown finals I some experimenting.Attempting to tune up above 29 Mhz was impossible.SWr and power went right of the scale,even with power turned all the way down.Frequency counter placed next to the open wire feedline did not show 29 Mhz but something abt. half of that,14,XXX Mhz.so there was some parasitic oscillation happening here.I have made the following modifications:first of all I removed the LPF board and cleaned and tinned all 5 mounting poits under the board in order to get better grounding.This helped somewhat,but it was far from perfect yet.Than I did the mod.as is picured on this webside with the copper straps screwed on to the centre rib.Rig is now rock stable and will tune any frequency up to 29.700 Mhz.To keep the V/U finals from destroying themselves I have cleaned all solder connections at srf 7043,there was a lot of solder flux left on them.I have also added a 68 Ohm resistor between the negative fan wires and ground in order to keep the fans running at low speed.rig stays nice and cool even after long periods of receive in VHF.And last I have added an extra ground strap from the centre rib to the coax connector J3001 on the PA board.Hopefully this will keep the V/U final amp from destroying itself,I am convinced that these also die because of a ground loop or parasitic oscillation,since several people have reported them blowing in receive.Hope this wil be helpfull.

Subject: [FT100] Re: spurious oscillation design flaw in FT-100D

I use my ft100 mainly as a base station.antenna is a multiband dipole fed with an open wire feedline thru a mfj tuner and 4:1 balun. Shortly after buying the radio and tuner,I had problems tuning on 10 and 12 meters.At first I thought the tuner was at fault,but after reading all the messages about high SWR and blown finals I some experimenting.Attempting to tune up above 29 Mhz was impossible.SWr and power went right of the scale,even with power turned all the way down.Frequency counter placed next to the open wire feedline did not show 29 Mhz but something abt. half of that,14,XXX Mhz.so there was some parasitic oscillation happening here.I have made the following modifications:first of all I removed the LPF board and cleaned and tinned all 5 mounting poits under the board in order to get better grounding.This helped somewhat,but it was far from perfect yet.Than I did the mod.as is picured on this webside with the copper straps screwed on to the centre rib.Rig is now rock stable and will tune any frequency up to 29.700 Mhz.To keep the V/U finals from destroying themselves I have cleaned all solder connections at srf 7043,there was a lot of solder flux left on them.I have also added a 68 Ohm resistor between the negative fan wires and ground in order to keep the fans running at low speed.rig stays nice and cool even after long periods of receive in VHF.And last I have added an extra ground strap from the centre rib to the coax connector J3001 on the PA board.Hopefully this will keep the V/U final amp from destroying itself,I am convinced that these also die because of a ground loop or parasitic oscillation,since several people have reported them blowing in receive.Hope this wil be helpfull.

# 12247. W8JW Durango Installation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-12 13:51:04 UTC
From: k4sah
Topic: 12247  Message: 12247

If W8JW is around, or if someone else knows, I would like to know
what bracket is being used to attach the ATAS to the luggage rack?

Also, does the owner feel if this is a sturdy installation?

Thanks,
Steve/K4SAH

I'm using a Diamond K550KM on my Subaru wagon luggage rack. So far no problem structurally (it does suffer form the loose center pin syndrome, and I'm going to put the small spring in the center pin socket for good contact). I think any SO239 mount will suffer that over time.

Sorry... one more: This mount is designed for ground-independent
antennas. You'l need a good ground strap from the base to the chasis
or rack.

> Just posted 3 pics to the 97 explorer installation pic area. Ft-100 is
on stalk I picked up several years ago at local stereo shop. Mic mount and
D-700 mount's simply slide into the cracks between the dash components. I
have a keyboard attached to the D-700 running APRS. I can log my mobile DX
contacts by sending an APRS message containing the contact info to my home
APRS station. When I get home I then enter them in my main log. I used
stanless screws to attach the mount to the side if the transmission hump.
When you put the screws in , check clearences carefully. I used screws about
1.5 inches long. Power is run directly from the battery, through one of the
rubber plug's in the firewall. D-700 body is just to the left of the
console.

I don't agree. There is NO pop-pop-pop when listening to weak AM or FM signals ( I regularly listen to non-local stations because on Long Island there are less than NYC stations 60 miles away.

I have no idea why, but perhaps the noise is diminished below 2MHz, maybe the very wideband nature of FM BCB doesn't respind, maybe the receivers are better somehow.

Sorry, guess I left part of the info out.

In the photo section there is a picture of an installation of an ATAS 100 on a Durango luggage rack by W8JW. This mount does not appear to be the diamond mount. It may be homemade or modified. Almost looks like a mount from radio shack that was made for a 3/8" stub. It appears to be very heavy duty.

But since the diamond mount was mentioned, is it heavy enough to hold the ATAS 100 up at highway speeds? Spec says it has a length limit of 45 inches.

Thanks,
Steve/K4SAH

Interesting. Can't explain the weak siganl AM noise performance you describe. I would guess that the signal strengths are still pretty strong.

As an aside, I used to live in Chappaqua, right down the street from Clinton's new residence. I know the road where his pup recently was run over. You turn left out of our old driveway and go up Bedford Road about 1/2 mile.

I would say the FM is quiet because most noise that you pick up in a car is amplitude varying in nature so the FM detector simply doesn't respond to it.

My wife owns an Explorer so I may have questions for you in the future if I try putting the FT-100D in there.

I went to the files folder and found that link. It looks like a standard RadioShack CB mirror mount with longer bolts. Users have been using one of those, and reversing the SO239-3/8 connector (i.e. the SO239 is mounted up for the ATAS, the 3/8-24 thread is mounted down, and you pigtail your coax, connecting the center to the 3/8 thread, and the ground to the mount).

I saw the 45" rating, too. All I can say is that I have been using it for a month now with no issues. I commute 45 miles each way to work at highway+ speeds. Your performance may vary. Use at your own risk.

My only digital capabilities are a first-generation digital camera (600x800 res?), but I'll see what I can get.

I actually had a fortuitous fail on one of my K550 mounts before I got the ATAS (I have a 2m/440 antenna on one side, and the ATAS on the other side of the luggage rack of a Subaru Legacy Wagon --- an Outback without the steroids). I went to loosen the tilt-over knob and it froze (5 or so winters, salt, etc). I muscled it with pliers and wound up breaking the head off the tightening knob/bolt. Drilled out the remainder. I found that a threaded stainless I-bolt (the kind where the bolt loops around on the end to a full loop:

O===

...fit under the SO239 and through the remaining hole, and then I put a large stainless fender washer over where the old knob was, then a wingnut, and then an acorn/end nut over the end of the bolt to keep from catching clothes/birds/passing squirrels. Well, it was easy enough to add a spade connector on the end of a ground strap between the washer and the wingnut, and then connect the other end to a spade and screw it down to the luggage rack with a stainless machine screw (and coat that end with liquid electrical tape). The whole thing actually works quite well. I'll see if I can get some acceptable shots of it.

There are no noise reduction features in car radios at all. I just checked the specifications of my Sony receiver and it has a sensitivity of 30 microvolts (-78dBm) on AM. This appears to be the level at which the signal drops below the AGC range of the receiver. Most other car radios I have checked in the past have similar sensitivity. I often travel to areas where there are no AM signals strong enough to be received at all. In these areas, many vehicles do suffer from ignition interference or noise problems from the alternator, fuel injectors, instrument regulators etc. Its no wonder that the FT100 appears to be poor in noise reduction when it is responding to signals at upto 30 or 40dBm lower in level. The FT100 noise blanker does a superb job on impulse noise.
On FM broadcast signals, the Sony receiver is specified at a useable sensitivity of 12dBf (no explanation of what the f reference is!) Quick measurements of other typical car receivers on FM broadcast have shown a typical sensitivity of about -85dBm for useable signals.
What this means is the car radio is just not sensitive in amany cases to hear the noise. A case of when a poor receiver appears to be better than a very good one.
The noise blanker has to do its work before the narrow filters in the FT100 (or any other radio) so its a compromise between effectiveness and intermodulation / crossmodulation problems with strong signals that would be outside the filter passband. Yaesu seem to have got it right in the FT100.

Grant, ZL2BK.

The scary part of all this is, that the lower-level techs at Yaesu may actually BELIEVE what they are saying, and not really know what they are fixing!!
Folks, if you notice the spurious beginning during a transmission, you'd better unkey immediately (especially if it occurs on VHF/UHF!) If you are bench testing, keep the rig in transmit for only very short periods of time!!

So I was right in that the AM broadcast are simply much stronger generally than many ham signals. Thanks for the confirmation.

Your comments about the noise blanker are interesting. It would be nice to have a tracking bandpass filter on the front end. We do that in the Gigahertz area with YIG filters. Just would be nice to have some band limiting before the first active element; but with a low insertion loss so we don't ruin our noise figure. You might be interested in my posting regarding "receiver sensitivity". Don't have the message number but it should be found by entering the topic into the search box.

Topic: 12141  Message: 12264

The noise blanker is ahead of the IF filters because the narrow filters stretch the noise pulses making them impossible to remove without severely degrading the wanted signal. The pulses are stretched because the narrow filters limit the rise time of the pulse. By removing them before they are stretched by the filters, the resulting small missing part of the wanted signal is not noticed. The blanker detects the pulse and a gate turns the signal off before it reaches the filter. Noise blanker width adjustment on some receivers determines how long the gate is shut for. The sensitivity sets the threshold at which the gate operates. Low sensitivity means the pulse must be much higher level than the wanted signal before the gate operates. This is why you have problems if the sensitivity of the blanker is too high and there are strong signals nearby but outside the IF filter passband.
I think the Yaesu FT101 series from the early 1970's was the first receiver to use this technique in the ham world.

Grant, ZL2BK.

> I will pass along what the tech at Yaesu told me. The "SWR X" icon means
that the rig is seeing a high SWR. The "SWR O" icon means that a "TUN"
operation to either an ATAS-100 antenna or an FC-20 tuner completed
successfully with low reflected power and it should not be seen at any other
time. If anyone knows or heard anything different please pipe up and fill
us in because I have no faith in the tech that told me this. He didn't know
much about the FT-100 so, while I was on hold, he talked to the lead FT-100
tech and then passed the info on to me.

Topic: 12232  Message: 12268

Folks, I am a owner of an 100D with this problem. Do you think a person with no skills in electronics could make the mods or I should send it to the tech service ? Tks --- "Bruce A. Chambers" wrote: Does he mean "brass fittings" or copper tape? I opened mine up to see what was inside. I was hoping to find a thermosister? Instead I found "copper tape" over the edges of the cover. Is this what you mean? TNX

Topic: 12232  Message: 12270

I suggest sending it in. Ask for two things: 1) "SWR icon" spurious oscillation "modification" 2) "VHF/UHF fan" "modification I wouldn't recommend working on it unless you have pretty good soldering and electro/mechanical skills. --- In FT100@y..., luiz lissoni wrote: > Folks, > > I am a owner of an 100D with this problem. A person with no skills in electronics??? I ask, are we not hams?! I would encourage you to do it yourself or to find an elmer that will give you a hand. You gotta start somewhere. Of course, if it is still under warantee, it's another matter. Doing it yourself would probably void the warantee. # 12274. RE: [FT100] SWR Question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 00:27:01 UTC
From: Blaine
Topic: 12236  Message: 12274

Hi John,

I received the same information from a tech who knows the FT100/D. The "O" is OK. This is not documented in my manual.

Blaine, VE7CQX
-----Original Message-----
From: John McClain [mailto:digi2@...]
Sent: Monday, February 11, 2002 3:17 PM
To: FT100@yahoogroups.com
Subject: Re: [FT100] SWR Question

I will pass along what the tech at Yaesu told me. The "SWR X" icon means that the rig is seeing a high SWR. The "SWR O" icon means that a "TUN" operation to either an ATAS-100 antenna or an FC-20 tuner completed successfully with low reflected power and it should not be seen at any other time. If anyone knows or heard anything different please pipe up and fill us in because I have no faith in the tech that told me this. He didn't know much about the FT-100 so, while I was on hold, he talked to the lead FT-100 tech and then passed the info on to me.

John

Subject: [FT100] SWR Question

OK, so maybe I missed something. What does the SWR icon with the O or 0(zero) mean? I get that on my FT-100 from time to time.

If it's explained in the manual, then I need to get glasses!!

Thanks in advance!!

Bruce

# 12276. tx mod didn't work

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 04:18:02 UTC
From: usgsj
Topic: 12276  Message: 12276

Hello listies.

I bought a used FT-100D which had been back to Yaesu for
the "hi swr" and "fan" mods.

I tired the expanded TX mod. Removded R6036 (R6035 was not
installed). I carefully went through the steps using
the [DWN] button on the front of the radio. I didn't see
the display "r on", "HF on" or "vU on" and it will not
xmit out of band.

Thinking I had perhaps used the wrong [DWN] button and
I should use the [DWN] button on the mic I went through
the steps again. Still no dice.

I had the rig on 375.72727 when I powered it up the
first time, and not in the HF portion - don't know if
that made a difference.

Does anyone have any ideas/solutions ? Perhaps
reset the CPU somehow and start over ?

TIA, John NA3J

# 12277. Answer from Japan on the removal of the FT100 manual!!

Dear Mr. Brinneman:

Thank you for your e-mail dated February 12, 2002, concerning the
distribution of manuals for our products.

Although we greatly appreciate your kind offer, our company policy does
not allow it. As our capabilities to write in English are limited, we
have forwarded your e-mail to our U.S. subsidiary. They will be in
contact with you shortly to answer your questions.

We ask you to kindly direct any further questions or concerns you may
have
to our U.S. office at the following address. They are more capable of
assisting you in your language, and will be happy to help you now or
anytime in the future.

Subject: need an answer, please

Greetings Ms. K. Sudo,

I was refered to your email address by:

Bob Baillargeon - VE3MPG
Ottawa Canada

I have made a mistake.
I am subscribed to a yahoogroup for the FT100(D).
I read alot of emails, concerning people whom had forgotten their manuals at home, and were out in the field or overseas.
I wanted to provide a scanned copy of the FT100 Owners Manual so that they could have easy access to it.
I did see the note on the back of the manual about reproducing it, but I took it as for me not to scan it and then sell it to make money for myself since you were the company that produced the radio and the manual.
I told some of my advisors that which I wanted to do, and they saw nothing wrong with it, as long as I did not sell the manual for a profit.
I should be shot for this. I know I should have asked you first before distributing it. And now after receiving an email from another ham, my consciense is bothering me.
---
Please, give me another chance. I am asking you now; is it okay for me to go ahead and keep distributing the Owners manual and can I do any other copying of Yaesu manuals for the good of your customers?? I am not intending at all to sell the materials, but only get reimbursement if need be, for shipping and handling.

I was also thinking of creating a two-CD companion for the group/owners of the FT-100(D) so that they could have the manual on CD with copies of the FT-100 Service Manual, Owners Manual, the ATAS-100 Service Manual, FC-20 Service Manual, etc... So when their 1-year warranty expires they

will have enough information to do any repairs on the radio down the road from now???

Please give me your answer.

Daniel Brinneman

Hi guys,

For you High Screwdriver Antenna guys, what voltage inputs does the antenna have?

Is it a +12V~+13.8V and a Gnd??

Or is it different than that.

# 12281. ALTERNTE WORKSITE

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 22:23:11 UTC
From: kb4ifs
Topic: 12281  Message: 12281

It appears my FT100D got alittle deaf when trying to tune it into a random length dipole. I thought it would work on ten meters and am using a FC-20 tuner. So I think I have the "SWR" problem.Is there an alternate site that will perform the modifications instead of Yeasu? I really want to get on the air and don't want to wait 6-8 weeks. Any suggestions?

# 12286. A Huge Find!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 01:55:57 UTC
From: maryarnx
Topic: 12286  Message: 12286

I too saw the television commercial for a company located at http://hk852.to/coupon It really caught my attention because a week earlier a co-worker was talking about the program at the office. I don't take anything for granted so I did a little research about the company and thought it might be a good idea to give it a try. Well it turned out to be a good idea. On my very first trip to the supermarket I saved over 85% on my total bill. The savings were just the beginning it even included 8 different items that I got for free.I must have read at least a dozen different posts of people recommending this product but I never believed that anything could be this good. Well having saved over $146 on my very first supermarket trip certainly made a believer out of me.

Steve, I have my FT100 installed under a Tuffy Consul with Diamond VSWR meters inside. I built a special thin brass plate that fastens under the VHF output connector to provide a real ground. This ties to a brass plate that fastens to vehicle body ground. The ATAS100 is motor driven, horiz to vert position, and is grounded to body ground on the roof of my landcruiser with one inch braid. The motor system (Diamond) sticks up abt 4 " above roof rack on the Toyota Landcruiser. All this stuff actually works.

# 12289. FT-100D es Battery Power

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 03:25:13 UTC
From: w6zip
Topic: 12289  Message: 12289

Has anyone expanded on the operation of the Ft-100D with say a 7-12 AmpHr battery and 5 watts output. Even though the rig does draw alot of current on receive, I would think that you could get 5-6 hrs. use and then some at low power. Anyone care to comment?? Thanks

# 12290. Re: [FT100] TX mod - did not work

Subject: [FT100] TX mod - did not work

Hello listies.

I bought a used FT-100D which had been back to Yaesu for
the "hi swr" and "fan" mods.

I tired the expanded TX mod. Removded R6036 (R6035 was not
installed). I carefully went through the steps using
the [DWN] button on the front of the radio. I didn't see
the display "r on", "HF on" or "vU on" and it will not
xmit out of band.

Thinking I had perhaps used the wrong [DWN] button and
I should use the [DWN] button on the mic I went through
the steps again. Still no dice.

Does anyone have any ideas/solutions ?

TIA, John NA3J

# 12291. Re: [FT100] Re: Active Mobilers

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 05:28:47 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 12141  Message: 12291

Perhaps the noise on the AM BC band is low because the cheap paper capacitors (with two inch leads) used for noise filtering by the auto makers are effective below 1.6 MHz and the natural noise rejection of the FM side of the broadcast receiver ignores the noise there. Probably all the existing coil primary and computer connection bypasses (along with the fuel pump and electric fan motors) need to have disk ceramic capacitors wired in parallel but with zero length leads between the power wire and ground. Difficult to accomplish unless the power lead is routed past a short standoff the height of the lead spacing on the disk ceramic capacitor, or a feed through capacitor is used for that standoff and the wire interrupted in its path to the coil or computer or electric motor...

# 12292. Out of band transmissions

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 19:00:32 UTC
From: ve7baq
Topic: 12292  Message: 12292

I wonder if I am missing something here. Why do we study, and try to learn operating practices and regulations etc. in order to get a Ham tickets and privileges that go with it? Why do people spend good bucks to buy an Amateur Transceiver and then spend so much time trying to get it to transmit out of the Ham Bands? The last I time I looked at regulations, this is illegal operation.

I can understand spending time and effort to make your rig work a bit better, or tailoring it to fit our personal tastes or requirements, or for more convenience in operating.

But "out of band" transmitting seems odd to me. Almost every day there is a message on packet and other modes griping about intruders on one or other of our ham bands. There was a discussion the other day on e-Ham I believe, about the FCC allowing commercial users to use some of the UHF bands for "temporary" operation for the
Winter Olympics. Almost everyone said no. Some said that this had been done before for some other function and the result was they are still using these frequencies on a "shared" basis. They were never returned for exclusive ham use.

Experimenting with our ham gear has always been a great part of Ham Radio. Almost all of our older hams have built their own rigs at one time or other and it has been good for ham radio, but to flaunt the regulations in the name of "I just wanted to do it" seems to me to be counter-productive.

# 12293. CATsPaw user poll

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-13 19:39:58 UTC
From: jordan0129
Topic: 12293  Message: 12293

hi,

just taking a poll on how many users would be interested in
registering for the CATsPAW version 1.0 program.

registration would be $20 and would include full version of the
CATsPAW Ft100 computer control program + help and user files + all
future updates.

i'm taking this poll because the current program which allows SWR
graph plot and Activity graphs uses a 'demo' graphing package. the
FULL graphing package costs $240.

if there is a lot of interest on CATsPAW, i will fork the $240 to buy
the package and release version 1 this March.

let me know.

From: hfolgering
Topic: 12232  Message: 12296

I use a liquid flux remover,available from most electronics
stores.Just spray it on,hold the board or radio vertical and let it
run off.Follow with a quick blast of (low pressure) compressed air,
and presto,all the flux is gone and the board looks like new..

Don't know how to tell you this, but, are you saying you opened your "NEW" FT-100D and the above mods were done to your "NEW" radio? Got my factory mods done in December 2001, and Yaesu is not using drilled screws anymore as shown in early mod pictures. Grounding straps are slipped over frame and clamped with grippers built into the straps. They have engineered the straps (probably have a part number) and are not just cutting, bending, sodering, and fastening copper straps.

Does Yaesu re-ship factory refurbished/returned radios? Do dealers have to tell that you are buying one? Would a dealer take a return and re-sell it as new? I suspect you have some investigating to do.

# 12298. Re: [FT100] ALTERNTE WORKSITE

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 01:50:11 UTC
From: france antelme
Topic: 12281  Message: 12298

From the limited literature available, the FC-20 has a very limited tuning capacity and was designed to match a load with a VSWR of no more than about 3:1 to the 50 ohms nominal that FT847/100 PA wants to see.

This means that it appears that it was intended to be no more than a "Line Flattener" capable of tuning out the VSWR excursions resulting from tuning a resonant dipole or beam from the top to the bottom of design band

i.e. Tuning a 40m dipole from 7-7.3MHz etc.
see the following URL:
http://my.en.com/~rayd/ft-847/FAQ/page2.htm#matchrange

So, I dont think that your FC20 is faulty - it just plain can't tune the load you are presenting it.

It isn't designed to match a random wire antenna which, depending on the length relative to the operating wavelength, could have a driving point impedance of anywhere between 10's of ohms to thousands of ohms, reactive.

If you want to tune random wire antennas, you need to use an ATU that was designed for the purpose.

The SGC 230/237/239 series ATU's are designed for tuning random length wire antennas and they seem to work well with the FT100.

Jack,
Sorry to hear about your noise problem. I don't have any suggestions other than the usual ones you normally hear. I have a 2002 F150 6CYL XLT Extended Cab with a manual transmission truck with the ATAS-100 mounted on top of a pickup toolbox located across the bed under the rear window and I have almost no ignition noise, alternator whine, or fuel pump noise.

From: Einar Carlsen
Topic: 12280  Message: 12306

Ok that would be a legit mod. The first thing an older ham asked me when I got my FT-100D was if it could transmit out of band! I aske him, Why? He had no valid reason except he thought it would be nice to try!
Now you se what I meant. If it is for a legit Ham use OK, but most just do it for no legit reason.
Cheers and have a good trip. Lots of DX
Einar

Hi Einar,

I'm planning an extended trip to Australia - their 70 cm
band starts at 420 MHz......

Cheers,
John NA3J

Again on the bigger user group board:

The Nomic sets up fast and works very well with the 817--no learning curve even for a dolt like me.

So, I look forward to using it also one day with my FT 100. Is there a conversion device from the larger FT 817 mike plug to the smaller FT 100 plug? And why would Yaesu make them different?

# 12308. Re: [FT100] HELP - Ignition noise is driving me nuts

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 11:39:11 UTC
From: Jeff kb2m
Topic: 12294  Message: 12308

Ford issued a service bulletin for the fuel pump noise. I don't have the number's here, as my 1998 Exploder is out of warranty and doesn't really have a big noise problem. Go to your Ford dealer and ask for any service bulletins they have on fuel pump noise. My dealer printed out quite a list, then looked up a part number from the list. I don't have this info any more as I gave all I had to a fellow ham who had a problem and needed the info. Some one on the list might have it, if not I can call my friend and get it and post it here this afternoon.
Bottom line, Ford will fix the fuel pump noise with a noise suppression device that installs INSIDE the fuel tank.

When I had my '95 Land Rover Discovery with a V8 I had the same problem. I put a set of Magnecor KV-85 spark plug wires in and dropped to ignition noise to zero even with the NB off. No guarantees but it worked in my case.

Some people in the US are authorized to transmit outside of the ham bands. One example is MARS and another is CAP. I am a MARS operator and transmit daily outside of the normal ham bands. All of my radios have been legally modified.

I wonder if I am missing something here. Why do we study, and try to learn operating practices and regulations etc. in order to get a Ham tickets and privileges that go with it? Why do people spend good bucks to buy an Amateur Transceiver and then spend so much time trying to get it to transmit out of the Ham Bands? The last I time I looked at regulations, this is illegal operation.

I have a 2001 F150 Triton 5.4 liter V8 also. I run an ATAS100 and a High Sierra 1500 from custom mounts off the trailer hitch in the rear of the vehicle. I also have the ignition noise problem, however the Triton I have does not have spark plug wires!, it uses eight (8) individual spark coils with eight (8) injector coils for each cylinder. The noise is coming from the coils, and is radiated. I have ferrite choked each set of eight (8) coil wires, and injectors, I have tried to use thin mumetal to limit the radiated enrgy, I have grounded the engine to frame from several points with heavy braid to a common chassis point. About the only thing I have not done is pi filtered the coil and injector leads. Shielding the eight wires from each of the injectors and coils to their source would be an extreme last resort since that would require removing the electrical harness to accomplish. I have also overbraided the coax feed line to the antenna and made the ground at the antenna to the same frame rail as the engine grounds. I also have a pi filter in the power leads from the battery at battery end and double braid shielded the power leads to the radio. I have the seperation kit and mounted the radio under the passenger seat with a 1.5 inch braid from the mounting screws thru the floor grommet to the frame rail, same rail for the engine and antenna, passenger side. All the seperation kit wires are ferrite choked and shortened to remove excess length. I have also braided the hood to the frame rail and all body panels to the frame, you would be surprised to learn they are not really grounded. I used my spectrum analyzer to measure each modification effect to reduce the impulse noise and found that none of them really helped the radiated energy getting into the antenna port. If I disconnect the antenna coax and terminate with 50ohm Narda load there is NO impulse ignition noise in the radio, but as soon as any type of lead is attached to the antenna coax the ignition noise is there. If you find anything that works that I have not tried I would appreciate some feedback, otherwise do as I do run with the NB almost at maximum and live with the vehicle noise or get something else to drive like a horse or mule that is RFI quiet!!!!

Other reasons for out-of-band transmit are:

1) as an If for a transverter i.e. 22 to 25 Mhz to run
a 222-225 Mhz transverter.
2) In an emergency - Part 1 of the US FCC rules is
real clear - to protect lives, you can transmit on any
frequency (But be REAL CAREFUL that it is a legitimate
emergency!!!)

Subject: [FT100] CATsPaw user poll

hi,

just taking a poll on how many users would be interested in
registering for the CATsPAW version 1.0 program.

registration would be $20 and would include full version of the
CATsPAW Ft100 computer control program + help and user files + all
future updates.

i'm taking this poll because the current program which allows SWR
graph plot and Activity graphs uses a 'demo' graphing package. the
FULL graphing package costs $240.

if there is a lot of interest on CATsPAW, i will fork the $240 to buy
the package and release version 1 this March.

let me know.

Not True. Just got my FT-100D back from factory TEMP/SWR mods one week ago (4 week turnaround time) and the grounding mod uses straps that are SCREWED to the rib/frame and also soldered in the appropriate places. The straps are pre-drilled and formed to take small screws (looks like they were manufactured just for this purpose). The installation is VERY neat and clean.

My new FT100D (1F....) had the same grounding scheme out of the
box... straps that are screwed in.

eric,

hi. this is a computer control program for the FT100/d radio. written in Delphi. no added DLL's or OCX's that might potentially cause problems in windows.

requires windows computer (win 95,98,me,2000,xp). serial port and of course the data cable for the Ft100

# 12320. Re: [FT100] Re: HELP - Ignition noise is driving me nuts

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 16:57:10 UTC
From: Bob Cheek
Topic: 12294  Message: 12320

Seems you have done just about everything possible to reduce or eliminate the ignition noise!

I have a '99 F-150 with the 5.4L engine. I have some ignition noise, but it's not that bad. In fact, it is not nearly as bad as my '92 Dakota with a 5.2L was. Depending on the noise level where I am at any given time, the background noise often drowns out the ignition noise. I would estimate that it, at it's worst, about 2 S units.

I have done no shielding or grounding. I had the FT-100 mounted on the front of the console (not using the remote mount) with a High Sierra 1500 mounted on the inside of the box just inside the tailgate. I have recently switched from the FT-100 to a IC-706MkIIG in the same location, same antenna, same results. One thing I did notice, the IC-706 seems to be less susceptable to the noise from the fuel pump than the FT-100. On the FT, the fuel pump noise was much louder than the ignition noise.

Funny how much variation from truck to truck.

I believe it draws several amps even at 5 Watts out. I know that doesn't seem reasonable but someone posted "current vs CW Pout" data sometime back and I recall it was several amps even at 5 Watts out. I would get a K2 for true QRP portable use. You'll probably barely get an hour of transmit time out of a 7 AH cell.

Personally I would go with the screws. I don't like the idea of
the "clips" losing force over time. I like the nice solid screws in
my rig!

Should I try installing that suppression device with a hot soldering iron? I'm a non-smoker so there should be no problem.

I would be very interested to find out if that rig with the mod was received by the retailer that way straight from the factory, or if there was a "retailer recall" that led to the mod being done. The point being that, maybe at some point Yaesu finally started doing the spurious mod on all its factory fresh rigs. Did you also get a thermal switch on the VHF/UHF PA or does your rig have upgraded firmware that lets the fans come on during long periods of VHF/UHF receive? If they fixed that too that's "late but great". The rig is finally being shipped in full form.

Now, has anyone found a substitute fan that runs a bit quieter than the stock fans but provides equal or more CFM??

It looks very similar to this:
http://www.k0lee.com/modpics.htm

I assume it came form the factory that way. Pulled off the shelf at
HRO Salem.

It does not have a thermal switch installed -- I installed the 50 ohm
resister mod myself.

The firmware thermal mod has been discussed, but I don't think I have
ever heard or had anyone confirm that an old and new FT100 next to
each other in VHF receive had the fans come on and off diffently
based purely on the firmware version. If anyone has, please correct
me. I had my rig on VHF for a month or so before doing the resister
mod, and I don't remember the fans coming on in receive only. I think
regardless of how old your FT100(D) is, you either have the original
firmware method (fans come on in transmit only in VHF), you have a
thermal switch installed by Yaesu at your request, or you devised
some circit yourself (either a 50 ohm resister, the Tokin filter from
Yaesu, or something more sophisticated) that is either maintaining
the fans at low speed, or switching them on at a set temp. I don't
think there has been any change at the factory with regard to thermal
fails.

Hmmmmm.....interesting. So they're (possibly) including the spurious oscillation mod in all new units but not the fan mod. That surprises me since I would expect them to want those fans spinning when the rig gets hot during long 2 meter receive sessions. I think Yaesu has a sizable "fan problem" right now in terms of losing 'fans' (i.e. clients). If I buy the next FT-1000MP mark VI for example could it possibly have one or two design bugs? I mean just minor flaws such as those that 1)don't allow you to transmit on certain bands, 2)blow your HF finals, 3)blow your VHF/UHF finals, etc. Remember, just minor items here.

This has been one interesting new rig to buy. I have never spent so much time before sleuthing around trying to find out the real story on a rig. My wife definitely has a negative bias towards ham radio equipment manufacturers after watching me struggle with the technical issues and then the subsequent customer/manufacturer discourse now known as "FT100-gate". I still can't comprehend why they didn't just fess up and issue a recall notice. The only reason I can think of is that they knew a fair percentage of the rigs didn't need the strap added and if they drew attention to it they would have a flood of free mod requests for rigs that never (or at least hadn't yet) had the problem appear.

But that still doesn't explain the fan issue. The fact is that the rig gets hot as heck in VHF/UHF receive and that can't be good for its components. Seems that there should have definitely been a recall on that.

Yaesu hasn't lost me as a customer but the FT-100D experience has taught me to do an exhaustive check on customer satisfaction before buying again. That goes for whatever manufacturer I choose for my next rig. eham.com and these Yahoo Groups bulletin boards are great resources for doing that.

# 12329. Re: [FT100] FT-100D es Battery Power

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 16:28:09 UTC
From: Glen Farough
Topic: 12289  Message: 12329

I have tried my FT-100D on a 7 amp hour battery...
Turning the intensity of your display down will reduce
the receive current to abt 850 ma.
I am worried about a brownout problem with the
transmit
though on a solid state radio. Yaesu specs the
voltage
requirement as 13.8v rather that 12v?
I am building up the interface to use the cat100
software that has the thermometor...I seem to remember
in the software discription a menu setting that
reflects the temp of the radio. It is operates at
a higher temp at 12v than at 13.8v it would likely
suggest a brownout (low voltage) problem.
What a great radio for all other functions!
It's too bad that FT-817 has no front end at all!
It is the qrp battery radio, but intermod from Japan
20 Khz away makes that radio useless!
Maybe the best thing to do would be to use an 18v
battery with 12v and 6v in series and regulate it to
13.8v?
Or use one of those 250w power inverters from 12v to
120v and your ac power supply to deliver 13.8 volts?
Good luck...If you find a brownout problem is will
be a relief to see one other problem to go along
with the temp and vswr spurious problem...
These two mods have made the FT-100D a pet!

# 12330. Scanning VHF/UHF

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-14 22:31:26 UTC
From: Bill Reid
Topic: 12330  Message: 12330

Hello All

Can someone tell if there is a way to stop the band switching relay from clicking when scanning both VHF and UHF channels?

I assume that it is not possible ,but just had to ask.

Thanks
Bill

Put the uhf channels in one memory group, the vhf
channels in another memory group and the 6m/hf
channels in another group and there will be less
switching...maybe a pin diode mod instead of the
relay?

Mine is OK now, but I did have to send it in.
It was originally OK, then wouldn't tune 10 meters, then wouldn't tune six either.
They replace a couple of capacitors under warranty.
This happened about the same the ft100 had some problems too, unknown it they were related though.
Both are working OK now.......
My complaints are it tunes slow and won't tune anything above about 1:3 to 1.
It also seems to loose its memory a lot, but that may just be me tuning to some freq nearby.

From: John McClain
Topic: 12282  Message: 12334

I have had good luck with my FC-20 but I have to agree that it is slow. I would think that a tuner that switches in L and C with relays would be a bit faster. I can understand a tuner with a variable inductor being sluggish but not one like the FC-20.

I have always wondered why the FT-100 tunes the ATAS-100 and FC-20 with such a high power output. I have the menu set for 50% power on HF which it does except during a TUN operation when the power goes up much higher. Wouldn't 10 watts be enough?

# 12338. FT100 List Etiquette

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-15 05:32:06 UTC
From: Lee Devlin
Topic: 12282  Message: 12338

I posted a message back in August that discussed list etiquette. I thought enough time has elapsed that it makes sense to post it again.

Shortly after my first posting, James, the list owner, changed the list to a 'moderated' status for new members because with our size and activity level we started to get spammed. After a few months, most of the messages were requiring moderation which became a big job. Recently, James put the list back on non-moderated status which means that a few spammers will invariably get through. We will throw them off immediately, so there's no need to post an objection and add fuel to the fire.

I'd like to reiterate a few simple rules which I feel have added more civility to the group. I realize these rules are not popular with everyone, and some have left the group as a result. But I still think it's necessary for the good of the group to periodically remind our members what this list is about and what constitutes bad behavior.

First of all, the list is to help owners and prospective owners of the Yaesu FT100. If the subject of your request doesn't fit that description, please consider other alternatives.

Here are the suggestions for making the list more effective:

1. If someone posts an offensive message, please, send him a PRIVATE message to
let him know you disapprove of it. It's not necessary to escalate it by
copying the whole list and further increasing the noise level in this group.

2. When you see a posting by someone who is obviously 'trolling', that is,
trying to get attention with an inflammatory posting, ignore it or you will
be giving him exactly what he wants.

3. Keep postings on topic. It isn't a place to discuss general ham topics. If you see a topic straying away from the FT100, please don't respond to it.

4. Don't send private messages to the whole list. If
the message is likely to
be of interest only to one individual, edit the 'TO: '
field so that only
that person gets the message. Here's an example: If
your message starts with, 'Hey, Joe, what kind of
options did you get with that Ford', then you should
send that directly to Joe, not to the whole list.
Here's another: An entire message that consists of:
'Thanks Fred'

5. Edit out as much of the original message as
practical when you're posting a
follow-up. Anyone sending a whole digest back to the
list will be spanked and then banned from the list.

6. Speaking of the digest, if you subscribe to the
digest, edit the 'Subject' field in your email when
replying so we don't get threads with meaningless
subject lines such as:
[FT100] Re: Digest Number 819

7. When needing help on a topic, first try the FAQ
and then do a search on the
Yahoo FT100 group web site to see if it has been
discussed before. Often
times, you'll find your answer there.

8. Before you post, please remember that you're
asking 1700+ other human beings
to read what you have written. Please be considerate
of their time.

Thanks and 73,
Lee Devlin, K0LEE
Greeley, CO

# 12339. Yaesu Involvement in the list

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-15 06:09:48 UTC
From: Lee Devlin
Topic: 12282  Message: 12339

Wouldn?t it be great if we had the actual designers of the FT100 participating in the discussions here? I would like to see a posting like the following:

?My name Yoshi Yamasaki and I design the PA board for the FT100. We have debates about fan being on during V/U receive, but focus group study show user want low noise, so we make calculations and determine that ~18C temperature rise inside rig pose no threat to electronics reliability. So we choose not to enable fan during this mode. If you think that rig get too hot, we think OK to jumper fan through 50 ohm resistor.?

[Disclaimer: The passage above is just a figment of my imagination.]

I?m one of the developers of the HP de100c Digital Entertainment Center. I found a Yahoo group like this one and felt it would be wrong to have customers left in the dark to solve problems on their own, so I have chosen to participate in the discussions. If you?re curious, you can find it at: http://groups.yahoo.com/group/hpde100c

I would expect that the designers from Yaesu would feel compelled to participate in these discussions to help dispel myths, correct wrong assumptions, and to help owners understand if what we discuss here is real or if it?s just our imaginations running wild.

I look at the design of ham radios today and find myself in awe of the amount of engineering and design expertise it takes to accomplish such a feat. I?d expect that those involved in the design would have enough pride in their work to make sure that it didn?t get trashed by those who had no idea how to design a similar product themselves.

I'm sure the owners would appreciate it and even though you may take a few criticisms, it would benefit Yaesu to participate and periodically clear up some misconceptions.

> respond to it.
>

Well, ( sorry if this is late, my email is backed up ) FM is "noise immune"
ONLY if it is strong enough to be driven into limiting. Weaker FM signals
hear noise just fine. Even if they don't, it seems to be that the noise
itself is so strong it drives the radio into limiting, raising the s-meter
and squashing the weaker sigs. Another reason why they should have allowed
the NB to work in FM

> My wife owns an Explorer so I may have questions for you in the

All I can add ( sorry if it is late ) is the "f" is FEMTOWATT

I think 12dBf is 12dB stronger than a femtowatt which is 10^-12 watt

Thanks

Hi Autotto12095, and members of the Group;
Since June 2001 I have the FT100D plus ATAS 100 installed in my car, also I have an Icom 2700 H associated with a dualbander Diammond 7900 in the same mobile.
In many travels I use both tranceivers to check each other with repeaters or radioham stations located more than 100 kilometers from my mobile station.
Without exception the FT100 got best reports and open the repeaters farther than the other equipment wich is working excellent.
I will suggest "autotto 12095" to check the instalation, continuity, masses, etc as the FT100D handbook recommend.
All the best, good contacts.

I do realize this is a bit off topic but i felt i had to chime in on this

That would be an excellent happening but unfortunately it may not be a
reality fopr the most part.

Anyone who is into Radio Control planes shoudl know who Great Planes is and
that they are the U.S. distributor of Futaba R/C gear i run mailing lists
about 2 radios that Futaba makes and i recruited for the list AnnMarie
Cross, the product support rep from Great Planes-Futaba as well as Don
Edberg, the individual who wrote the manual and aftermarket manual for the 8U
radio and, I also recruited Red Schoefeld (i hope i spelled his name right)
he is known as the battery expert.

I wish all companies would be willing to have such an involvement with their
customers becuase it makes their job easier
they get the info directly from the customer instead of bogus survey's

It's a doubled-edged sword.
I work in this role for a software product (product definition, direction, new features, etc.). Think of the experience much like this list -- on one hand, it's an excellent resource for direct contact into the grass roots information from the customer --- can you imagine how long it would have taken most of us to establish the information base encased in Lee's FAQ and in this list on our own without the internet?

On the other hand, sometimes it's nice to be one level removed from the customer :-)

Scott Robbins (W4PA Product Manager) from Ten Tec can be found in their reflector from time to time. I think he strikes a good balance of addressing larger product direction issues with the grass roots users without getting sucked into "my Ten Tec is broke and it sucks and what are u gunna doaboutit!" That's the secret for anyone who works in this role.

It's not a "scam"; it's called "spam" which is basically internet advertising thrown anywhere someone might view it. You can contact the 'owner' of this bulletin board and he can probably kill it.

Everything I've said about the flaws in the rig is true.
End of story. The FT-100 was a problematic rig with an associated cover-up. It stinks. Credibility of the company is permanently damaged. To think otherwise is a psychological attempt to convince yourself that you didn't buy a rig that had two design flaws. You didn't make a mistake - Yaesu did. If you think otherwise you need to go see a shrink. Don't be an idiot. Wake up and face the facts!!

But that's just one model. Overall the Yaesu products are outstanding performers. I wouldn't sell mine for less than $1000 bucks. Includes AM filter and all mods done at Cerritos. Works perfectly. Any takers? Of course not - the new price is about $800 plus $100 for the AM filter.

I don't want to sell it anyway. I like the rig! Just wish I could quiet down these fans. Any ideas?

I use the FT100D only for CW . The 500 Hz filter isn't terribly sharp and the 120 and 60 Hz DSP settings do nothing more than the 240 Hz DSP filter except for attenuate the signal, but overall its performance is pretty good.

The main problem with operating CW with the FT100 is difficulty moving around the menu structure. Keyer speed is in the menu structure and not immediately available from the front panel. To generate a side tone to zero beat another station you need to turn of BKN and KYR and hold the key down while turning the vfo. Not easy while driving. There is no XIT and to operate split or change filters you need to go to another function screen. With the number of buttons and the display it would have been relatively easy to make it much easier to operate but, it would seem, nobody that actually operates radios had input into the design of the user interface.

# 12352. Re: CW operation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-15 18:46:29 UTC
From: backhoefade
Topic: 5045  Message: 12352

I bought my FT-100D mainly for CW operation. I don't understand your comment about "zero beating the other station". All I do here is tune in the guy and then transmit. The offset is automatically done and the amount of the offset is set in the menu. The name of the function escapes me right now but I think it's called CW offset or some such thing. You can set it at 600, 700, 800 Hz, etc. You can see the T/R frequency delta when you key up. Know what I mean? A lot of operators don't - and you don't have to understand it either. That's the operational simplicity of it. In other words, you and the other guy are listening, for example, at 7.010 MHz but when either of you transmit your carriers are at 7.010 MHz + 700 Hz (or -700 Hz if you have the transmit offset set to the other side of the receive center frequency). So you hear the product detection result of the demodulator mixing your local receive local oscillator at 7.010 MHz with the other guys incoming signal that's centered at 7.010700 MHz which is 700 Hz. You don't have to understand it; just enjoy it.

Topic: 5045  Message: 12353

Zero beat means to tune exactly to the other stations frequency. With vitually all modern rigs you hit the Spot button and a side tone is generated. You tune the VFO to exactly match the pitch of the desired station to the side tone pitch. Since the sidetone equals the receiver offset this puts you exactly on the other stations frequency.

OK! OK! I will take my forty lashes with a wet noodle! As some have reminded me (many times!) there are some legitimate reasons to alter the transmit parameters of your radio. (Operating in a country with different freq. allotment, CAP, MARS, even as a transverter to get on higher fregs, as well as in a REAL emergency, relating to danger of life and property, etc.) Incidently, our rigs already allow transmitting on the Alaska emergency 5167.5 KHZ freq. in an emergency but this is accessed via menus not the dial tuning and must only be used in an emergency and either in or within 92.6 KM (57.5Miles) of Alaska.
All this is true, but I think when someone advocates these mods they should also mention why they do it, so that anyone reading those posts and ideas, see why it is done. We on the west coast of BC have had problems with fishing boats, tugs, and private vessels using the ham bands for unlicenced, private non-ham communications (80 meters and 2 meters), because someone has sold ham rigs to unlicenced individuals, and/or someone in the business has opened up their commercial rigs without making sure they were hams. Not everyone in sales asks for a proof of license. Not everyone in sales is aware that this is necessary. (They should be . . .but). When I bought my FT-100D, the sales person wanted to know my call and address and they looked it up to check. Not every sales person is that careful. You are right there are legit reasons, but for the sake of newer hams include them when you mention them. Not only will it help keep someone out of trouble, but it just might generate some really new and valid uses for a really good rig.

I use my 100D with a 7 AH , with one battery plus a spare one and a wall-wart and one inverter. We can?t compare FT100D to a simple QRP, cause power always will be power !!! Tks
--- backhoefade wrote: I believe it draws several amps even at 5 Watts out. I know that doesn't seem reasonable but someone posted "current vs CW Pout" data
sometime back and I recall it was several amps even at 5 Watts out.
I would get a K2 for true QRP portable use. You'll probably barely
get an hour of transmit time out of a 7 AH cell.

Some operators make their rig output a tone so that they can match the frequency of their sidetone to the other guy's frequency. Never really used that myself, either.
When I operate CW mobile, only the lack of one-button access to the speed control is an inconvenience. I think the DSP filter works pretty well for what it is.

It should be in the main function menu not in the secondary F menus.
Look for 430 and 144 MHz power for the V/U amplifier. I don't remember
the menu number but it is next to the mic gain menu in the function
settings.
How much power is yours doing in VHF and UHF ? And which device did you
replace it with ?

Topic: 12366  Message: 12366

Hello fellow hams,
I have been reading some of the posts here and thought I would add my 2 cents worth. I have been a ham for 22 years.I have always bought Kenwood,Icom, and Ten-Tec radios.A few days after Xmas I purchased my first Yaesu rig,the FT 100D.Well I should have asked the salesman what the serial # was, but I wasn't aware of the problems with this model. It didn't have the mods done and they didn't have any "fresh" radios in stock. It seems to me if you are going to part with some of your hard earned cash, the equipment should perform to your satisfaction right out of the box.Anyway,the rig was sent out on Jan 9th and arrived at my front door on Feb 11th. I hope to have it installed in the truck this weekend(along with the ATAS-100)and will post some more comments.73's to all......KD3D-Frank

> Is this the first communication involvement from the
> Yaesu folks???

Maybe they forgot to read the etiquette posting about staying on topic :-). This is the main reason that the group was moderated for the past 6 months. James and I got to read this stuff before blasting it into oblivion. Unfortunately, even the legitimate mail has to be sorted and that takes time and effort. So that's why James put the list back into a non-moderated status. You must realize that people who do this don't hang around to read any tirades starting with 'Get your spam off the list!' So don't waste your time trying to influence them.

It's OK, he's gone and if he or someone like him resurfaces in the next few days, we'll probably have to go back to a moderated list...sigh...

# 12370. Zero beating

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-16 00:04:26 UTC
From: lhlousek
Topic: 12370  Message: 12370

Don't want to (zero) beat a dead horse here so the easiest thing to do is to refer you deadbeats to the article "The Importance of Zero-Beating". It appears in several places in ARRL publications including page 7-28 of their introductory book, "Ham Radio Made Easy".

I don't know of any law that requires it but it is considered good operating practice. To quote the article, "This is truly an important concept, so work at developing your zero-beating skills. When you've mastered it, you will be a more competent operator, and the skill will increase your ability to make and hold contacts on the air."

The relevance of this to the FT100D is that its obtuse user interface makes it more difficult than necessary.

# 12372. Best Mobile to Mobile Bands?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-16 03:39:36 UTC
From: BillBDallas
Topic: 12372  Message: 12372

Several friends and I have recently all purchased FT100's and ATAS antennas for our vehicles. We will soon be doing some exploring in the SW desert, and I am looking for opinions on which ham bands may be most useful for us.

Obviously, if we are within a few miles of each other, VHF or UHF may be the most useful. However, there will be times when we will be 5-20 miles or more apart. Can anyone offer their experience in this type of HF experience and shorten our learning curve?

BTW, the area is fairly rugged, and somewhat mountainous, with the possibility of needing to communicate from inside one canyon to another.

# 12373. FT-100 spam list?

Lou,
We don't mean that we don't zero-beat...We just do it by estimating the tone by ear, without a spot button (which, out of my twenty-some HF rigs over the years, none has ever had.)
The relevance of this to the FT-100 is that you can do it with yours, too!

Try 6 or 10 meters. That's probably the best ground wave for most of the day. I would say that 6 might be the best as when the band's dead 20 mile mobile contacts are easy, but stay off the calling freq of 50.125 in case the band opens.

Bill,
First I would ask if you and your friends are licensed amateurs with the privileges to operate in the HF band in the first place. You don't put your call letters on your post and anyone who was really licensed to operate HF would know, or at least should know, what the basic properties of propagation are for the frequencies they are using.

If you are not licensed I would advise you to stay off the ham bands and get commercial or CB radios instead.

I guess my first question is whether you are all licensed hams and what class licenses you hold? This will help in determining what freqs you can use!

Hmmm.... I just got my HF privileges a month or so ago after over 20 years as a licensed amateur, and I don't remember anything in the Morse assessment I took a couple of months back about propagation on the different HF bands.

Perhaps the Morse test taken Stateside includes an HF propagation test too.

I am therefore reading lots, and learning as I go. I think that this is part of the self-training aspect of amateur radio.

I thought it was quite a pertinent question if someone has never gone HF mobile before.

I do agree with you though that it is a common courtesy to leave one's personal and callsign with any post. Let's hope that they are indeed licenced amateurs.

Subject: [FT100] Best Mobile to Mobile Bands?

Several friends and I have recently all purchased FT100's and
ATAS antennas for our vehicles. We will soon be doing some
exploring in the SW desert, and I am looking for opinions on
which ham bands may be most useful for us.

Obviously, if we are within a few miles of each other, VHF or UHF
may be the most useful. However, there will be times when we
will be 5-20 miles or more apart. Can anyone offer their
experience in this type of HF experience and shorten our
learning curve?

BTW, the area is fairly rugged, and somewhat mountainous, with
the possibility of needing to communicate from inside one
canyon to another.

# 12390. ATAS Antenna Mount Problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-17 02:32:04 UTC
From: ke4cqw
Topic: 12390  Message: 12390

Hello all,

Well as much as I hate to admit it I am at a loss to
solve this problem so I figured I would ask all of you. I live in an
apartment complex that is nice but some people here like to bend or
remove the antennas off of people's car. To tell you how bad
they are, a sheriff's dept car had all his antenna's
"removed".

Enough of the back round around here my problem is I have
a Comet quick disconnect antenna mount with the "small" coax, I have
trouble with 6 meters and know that the removable part is the problem
because of the lack of a good RF ground. I just killed the coax in
the trunk and instead of spending a lot of time trying to repair the
coax problem with different coax I would like to replace it with a
hideaway fold over trunk mount. I was looking on line and was going
to hit up the better half for an early birthday present I noticed a
small sentence in the description and installation instructions on
the K-601 antenna. Not for use with antennas that require a ground.
I was shocked to say the least, now I have a dilemma what do I do to
keep my antenna ripped off? I don't really like the quick
removal Comet mount but what do I do.

I hope that someone is using the K601 with ATAS-100 and
that it works with maybe some modification. 73 all.

Subject: Re: [FT100] HELP - Ignition noise is driving me nuts

> Ford issued a service bulletin for the fuel pump noise.

The subject is ignition noise, how did we change to fuel pump noise?

Ignition noise is a pop-pop-pop that varies slightly with engine RPM.

Fuel pump noise is a buzz, that can be easily heard as you turn the key from OFF to RUN without starting, you hear it for a few seconds, then it cuts off.

I don't have the number's here, as my 1998 Exploder is out of warranty and doesn't really have a big noise problem. Go to your Ford dealer and ask for any service bulletins they have on fuel pump noise. My dealer printed out quite a list, then looked up a part number from the list. I don't have this info any more as I gave all I had to a fellow ham who had a problem and needed the info. Some one on the list might have it, if not I can call my friend and get it and post it here this afternoon.

F1PZ-18B157-A

if i recall.. I am on a plane. Search the archives for F1PZ that I am sure of. I sell them at a ham discount if you want.

> Bottom line, Ford will fix the fuel pump noise with a noise suppression device that installs INSIDE the fuel tank.

Well described.

Please go sit on your dealer's desk, demand an audience with the field engineer, and complain loudly. Show them it goes way beyond 30MHz so they can't hide behind an excuse.

If enough of us annoy the factory en masse maybe they will hear.

Thanks

I would suggest 80 metres as well. I have used it mobile for 30 years and had a lot of success over these distances in daytime (no VHF or UHF generally available to us then!!). Great band at night as long as atmospheric noise is not too high.
One thing that might be worth trying though, when you are trying to communicate from one valley to the next is to pull your antenna down to almost horizontal, across the top of your vehicle. Of course, this requires the antenna to be mounted high on the vehicle. This can sometimes help by providing a very high radiation angle with a small reflected signal coming down in to the next valley. I have not tried this myself, but have seen the idea written about quite often. Let us all know how you get on.

Grant, ZL2BK.

Mark:

Your response demonstrated a rather arrogant attitude. Frankly, it is attitudes like yours that turns many newcomers off from this fine hobby.

We are all licensed, and I did not realize the "protocol" of leaving your call letters with your posts. We are also relatively new to HF, and mobile HF in particular. I was looking for first hand information based on actual experience (as opposed to theory).

For those of you that responded with useful suggestions, thank you, and more suggestions will be appreciated. I would also be interested in hearing of what people have found not to work, as well as what does work.

The 6 meter report from Dan sounds interesting. What is the maximum reliable distance experienced by others for Mobile-Mobile 6 meter? How much is it effected by topography, specifically, desert type buttes and canyons? Does the ATAS antenna work as well as a dedicated 6 meter antenna?

Thanks again in advance.

Try one of the antenna bases that drop down into your trunk when you are not using it.
You may have to rig one up yourself that can handle the weight of the ATAS-100.
A metal shop can probably help you out.

Its a figment of theirs also :-) Anyway, the radio can be
likened to a "diamond in the rough". With a little coaxing (and
soldering) its sweet to operate.. Its a shame the big "Y" works at a
snails pace to rectify these problems..
The Joke is on them though, I am sure if they corrected these
problems in a timely fashion, they wouldnt have an 8 week lag time
for repairs. In addition, they probably have an S-Load of these
things (broken of course)in an area-51 type warehouse piled up like
sardines all due to their lack of response to the important issues
raised here. They forgot this is a hobby of communication and much of
it is about equipment and the internet assists in the dissemination
of it as well.
Problems with equipment or queries into buying radios are often

addressed here on the web and the lack of timely service and updates nets you a bad rep. Many of their sales are to the unknowing and once burned, twice shy as they say. The radio is a great piece of equipment. The complaints are always the same and often the info goes around in circles to the new "burned" owners who didnt know..
Its to the point where we can diagnose our own rigs as the three complaints often heard here are now no brainers.. A fella here had problems with his FT100 crapping out and it occured to me that something came loose.. Surely that was in fact the problem.. A push on a ribbon connector put him back on the air. This shows us that they are great radios, just victims of their maker in their slow response to the important issues..
I dont expect too much input from them as the lawyers would recommend against it. In my book though, its better to admit problems and offer to correct them and in addition mod the newer runs in a timely fashion to show that you take pride in your products.. Pay attention to what people want and you will surely make money. Kenwood, Icom and Ten Tec are doing just that. Radios that can be updated via software and changing equipment with the times are what we want. I often hear the contrary from owners of older rigs who get mad when an updated version comes out (Icom 756 owners ie.) Isnt it better to be offered a more advanced radio rather than stare at the same model year after year? I think its cool that rigs are advancing and updates are happening. This is a good thing!
For those just attending, dont become a victim.. Do the mods and enjoy the rig, the sooner you correct these problems, the longer you will enjoy the radio. Regards.. Richy N2ZD

From: ft100guy
Topic: 12294  Message: 12398

One ham once said that there is a cure for this:

1. remove dc line and coax from radio.
2. remove radio mounting bracket
3. remove offending Ford Product from under radio
4. replace defective Ford Product with GM product
5. Reinstall radio bracket,dc line and antenna
6. Lower NB and resume Ham activities..

In all seriousness, check the injector lines in addition as they mimic ignition noise as well. Your problem is not in the grounding that you are doing as it is strictly entering thru the antenna as evident by your description. I know there is a fuel pump dilemma with these vehicles and a kit is available although some have had lackluster results when using it.

Try a few unconventional things as different spark plugs, slightly different plug gaps, coax lengths and rear mounting the radio as close to the antenna as possible. In addition, try a deep cycle marine battery in a battery box as close to the radio as possible, eliminating the radios need for dependancy for power from up front (add an isolator and leads to charge it) The reason I added this comment is that I noticed no interference from Ford Products when sitting next to one at a light. Meaning that the radio when disassociated from the vehicles electrical system will eliminate much of what you are experiencing. I am very familiar with the 5.4 Triton series and being that the coils are mounted over each plug eliminates the need for wires,I would also suspect that the computer is generating much of this noise as well as it handles the spark control for the coils. Its a tough one to fix as it is radiated RF and its not coming in thru the dc line, supressing the radios need for the Fords electical system for power seems like an unorthodox but likely way to go as I can see that your problem doesnt present itself to other vehicles with ham gear in close proximity to a Ford. Just a thought.. regards.. Richy N2ZD

Check out the license plate mount from Lakewood (Hamstick people)

You can ground it and it works swell! I used it with my Atas and it worked fine and dandy like a sweet piece of candy.. If you must have a fold over type, get yourself a large washer and solder a braided wire to it and sandwich that between the connector and the atas.. If you want a quick fix for your coax, simply snip off the damaged part and get a quick connector from Radio shack. It has a needle which goes into the center conductor and a lock screw to grip the shield. Works fine for a quick fix and its reuseable. I keep one handy in case the coax takes a dump while on the road.. Regards.. Richy N2ZD

Oops!! Just remembered the ATAS won't tune down to 80metres, the main reason
I lost interest in obtaining one.

Six meter ssb may be your best bet, but you may want to check out 10 and 2 meter ssb as well. Ground wave propagation on those bands is pretty good. I don't know how the ATAS does on 2 meters but I suspect it is OK on 6 and 10. I am using my FT-100D with Hamsticks and quick disconnect mounts on 10 and 6 meters, with a separate dual band antenna for 2/432.

Have fun with your new radios and mode of operation. HF mobiling is loads of fun, and the FT-100D is a neat rig!

Good luck and 73,

I use 2 meters and 70 cm to make mobile to mobile contact out to 50+ miles
and mobile to base contacts out to 130+ miles. I was running a diamond
sg7900 and 150+ watts on 2 meters and 100 watts on 70 cm. the diamond sg7900
is 5 db on 2 meters and 8 db on 70 cm.

I would suggest 80 metres as well. I have used it mobile for 30 years and
had a lot of success over these distances in daytime (no VHF or UHF
generally available to us then!!). Great band at night as long as
atmospheric noise is not too high.
One thing that might be worth trying though, when you are trying to
communicate from one valley to the next is to pull your antenna down to
almost horizontal, across the top of your vehicle. Of course, this requires
the antenna to be mounted high on the vehicle. This can sometimes help by
providing a very high radiation angle with a small reflected signal coming
down in to the next valley. I have not tried this myself, but have seen the
idea written about quite often. Let us all know how you get on.

# 12403. Mobile Bands

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-17 15:11:13 UTC
From: Freddy Thompson Bratton
Topic: 12403  Message: 12403

In reference to Bill, KD5JWA's question on mobile bands: I spend a lot of time on 20 meters. I am a salesman and spend a lot of time in the car every day. I am on a 20 meter military frequency until noon CST most every day then I wander to other known 20 meter DX nets, all with success. It seems that seldom will a week go by that someone doesn't mention how good the signal is and is surprised that I have identified as mobile. The ATAS has been a great antenna. I think my favorite mobile band is 17 meters. It is a small bandwith and you can quickly find someone on it but it is seldom too crowded. Keep in mind virtually all of my "mobilin" is done during the work day when most people are unable to use their rigs.

I think the "100" is a great rig. The ATAS makes it ideal for me. I live in Memphis and travel the surrounding area and I am in places that I wouldn't risk someone stealing or more likely vandalizing the antenna. I can unscrew the ATAS off the Diamond K 400 mount and have it in the trunk in moments, cap the coax for protection against the elements and I'm gone. I don't argue that a screwdriver would be more effective but the ease of the ATAS sold me on that combination over the ICOM. I still wish I knew which rig was really best recieve, audio, DSP, NB with the same antenna under identical conditions. I have ICOM fans that insist their rigs actually have the advantage most of us feel ours have.

I read the post daily and see all the complaints on our radio. Granted the SWR mod and the fan mod are both necessary. I sent mine to Cerritos and was very unhappy with the turn around time. It was about 10 weeks. However, put that aside, I have been trouble free since and feel that that aggravation is a small price to pay for a rig and antenna system that has performed flawlessly ever since. Those are the only two problems I have ever had. Again, I am continually amazed at the reports that I get regularly. Many reports are " I can't believe you have that good a mobile signal". With those overall results, the pain and aggravation of the trip to Cerritos and the $75 fee for alignment-----or whatever are slight------not forgotten but slight. I'd take these aggravations to have this rig. I spend hours------hundreds of them on the 100--not even the "D" model.

I have not had another mobile rig before this so my experience is limited and I don't have ANY expertise. However I do have a lot of hours of enjoyment because of this rig. If I thought I would be better off with another rig, I'd order it as soon as I post this to our reflector. I don't measure its success with testing equipment numbers, although they are certainly valid, I use what I can do and can't do. I hear others that have quite a conglomeration of antenna and other eqipment-----most aren't getting any better reports than I am and many aren't as good. Success with a rig is if you are happy with the results because them meet your needs.

Lastly,don't be offended by the question of license. Most all of us are vehemently trying to keep our bands clean and our hobby as pure as possible. Consider that a worthwhile concern from whomever questioned it. It might surprise some how often concerned amateurs run a call sign thru QRZ ect to be sure it is legit. Remember, we are basically a self-policing organization. Riley Hollingsworth was our lead speaker at the Dixiefest in Memphis last weekend and he again pointed that out.

Thanks for the space:

Bill,
I use a simple 6 meter helically wound stick. The SSB contacts on 6 meters mobile have been consistent with ground wave propagation. Our terrain here is rolling hills to peaks of 2500 feet. I saw one 2 meter suggestion using sideband, but I think that's stretching it in your case. The reason I like 6 meters for this is that if the band is not open to E or F layer propagation, you'll have the whole band to yourselves as many others look for the "skip" conditions to operate 6. Try it around town with a few guys to test it. On the ATS 100, I haven't been impressed with what I have seen. I use a DIPLEXER to split the HF between an Outbacker Perth Plus for 40-10 meters with a Z11MP LDG autotuner and then the simple stick for 6 meters. The stick is outstanding for mobile and I can work anything I can hear even when the band is hot to E and F openings. Have fun!!

W1PO, Dan

Topic: 12372  Message: 12405

Seems like the opinions voiced here suggest either 6 or 2 meters SSB. In this case it should come down to the antenna. I've had excellent results playing around with 2 meter SSB mobile to mobile at good distances. On 6 meters, I've chewed the rag with a friend on SSB from my mobile with the FT100/ATAS-100 combo, while he was at home with a J-pole built for 6m. It may have been his J-pole or my ATAS, but I would have thought the gain would have been a little higher.

IMHO, 2 meter SSB with a hi-gain antenna (as per Tom KD4WOV) would be the winner here. We all know the ATAS-100 is a compromise antenna. I have the Diamond SG2000 2 meter monoband antenna, at 5.2 db gain I can echo Toms sentiments that it really gets out. It's not for everyone though, at over 62 inches in length. But if you're in wide open spaces (with the odd canyon thrown in for interest), I think it'd be a hard combo to beat.

Well, I sent my FT-100D to Cerritos yesterday to have all the mods done. I spoke to them earlier this week and was told I can expect to have it back in 5 weeks. Anyone experienced their latest performance standards on turn-around time lately??? Is 5 weeks realistic? Thanks and 73's

Dennis (WD5FOX)

# 12411. Re: [FT100] Re: Best Mobile to Mobile Bands?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-17 16:14:20 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 12372  Message: 12411

I advocate 2m or 432 because I regularly work rovers out to 200+ miles in SSB on those bands where the rovers have simple antennas such as single or stacked halos. And the rovers work each other decently, generally preferring the FT-100(D) to other radios because of the better performance of the FT-100(D) receivers. When working home stations on 2m SSB horizontal polarization is preferred. There is some slight evidence that horizontal polarization gets past the horizon better. SSB is always better at working DX on any band than FM because the receiver bandwidth, and thus the noise power is much smaller for SSB than for FM (or AM). And SSB does not have the abrupt threshold characteristic of FM.

I used to run MARS nets simultaneously on 2m SSB and 4.020 MHz. Signals were always better on 2m than on 75 meters for the same 100 mile paths except for occasional deep fades on 2m. Those deep fades, usually about twice an hour, lasted only a part of a minute each. Too much fade for a commercial 100% reliable circuit, no significant bother to amateur radio communications.

Even the ATAS100 should be more effective on 2m than on 6m though a dedicated antenna for either band will prove to be better.

I am looking for anyone who has installed a ATAS 100 on a GMC 2002 Envoy.

I am interested in Where and how you may have installed the ATAS 100 on the
this vehicle.

Please email me direct at
KB3DWR@...

Thanks

From: John McClain
Topic: 12414  Message: 12416

Over the past couple of months I have read here on the list that people are waiting anywhere from 5 to 12 weeks for warranty repairs. Does Yaesu extend the warranty time by the same amount? It seems to me that this would be the fair thing for them to do. It isn't fair for them to keep the radio sitting on their shelf while the warranty period is running down.

Before you send it in, open the top and bottom covers and reseat
all connectors, chances are something came loose. In addition, wiggle
the pigtail connectors and see if they are cold soldered to the board
and/or a possible broken connection inside the pigtail coax itself.
We had one pop up here the other day without HF rx and it was a
loose ribbon connector to the board. Dont lose the radio for 8 weeks
if you dont have to. Regards.. Richy N2ZD

# 12424. RE: [FT100] ATAS-100 on 80m

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-18 01:38:32 UTC
From: Bob Cheek
Topic: 12409  Message: 12424

All,

The ATAS-100 is a very short and uses a significant amount of inductive reactance to tune it on 40 meters. Add to this the fact that the inductor is a very fine wire and has a relatively high loss. So, the lower you go in frequency the more inductance, the more loss, the less efficient the antenna becomes. Any mobile antenna for 40, 80, and 160 meters is typically pretty inefficient. As you go lower in frequency and add inductance to the antenna to tune it the radiation resistance is reduced. A center loaded 8 foot whip can have a radation resistance of 10-15 ohms. Adding to the losses in the antenna are the ground system losses. The ground resistance that the antenna is driving against is only that of the capacitance of the vehicle to ground and of course the ground resistance goes up as the frequency does down. This compounds the problem driving a low impedance antenna. So, basically the lower you go in frequency the everything starts to work against you.

My experience is that the ATAS works pretty good on 20 meters and above. I changed from the ATAS to a High Sierra HS-1500. This antenna provides better performance on 40 and 80 meters, but it is also three times the size of the ATAS-100. To wind up this ball of string, it is perfectly normal for your reports to be better on the upper frequencies than on 40 meters.

With mobile antennas as well as other things, Size does count!

That's my two cents worth.

# 12425. Hooking MD-100A8X to FT-100D!?!?!?!?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-18 04:03:59 UTC
From: asi_tek
Topic: 12425  Message: 12425

I just bought the Yaesu CT-69 6 pin modular to 8 pin Yaesu adapter for my FT-100D. I am using the FT-100D in the shack. I need to know if I can just hook up a brand new Yaesu MD-100A8X and call it a day or do I need to modify (internally) the MD-100A8X mic in any way to make it compatiable with the FT-100D. Please let me know what I should do!!

Thanks!!

# 12426. RE: [FT100] Best Mobile to Mobile Bands?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-18 04:02:25 UTC
From: Tom Tishken KD4WOV
Topic: 12372  Message: 12426

acutely the distances listed was for FM, I was not sure you would be using SSB. But I can say this on 2 meter SSB add about 35% to the miles listed. We found SSB mobile to mobile even running vert, as opposed to horz, we gained 35 to 40% over FM on 2 meters. Using that diamond I have worked into NM and AZ on 2 meter SSB along with AL, FL, and GA from south west Missouri.

If you use the Diamond or just about any antenna, use a thru the body mount. I have used my SG7900 on a 3 magnet mag mount and it was 4 to 8 S units down on the mag mount compared to running it mounted thru the rear drivers side fender. This was done using the same cable and mount.

Subject: RE: [FT100] Best Mobile to Mobile Bands?

Seems like the opinions voiced here suggest either 6 or 2 meters SSB. In this case it should come down to the antenna. I've had excellent results playing around with 2 meter SSB mobile to mobile at good distances. On 6 meters, I've chewed the rag with a friend on SSB from my mobile with the FT100/ATAS-100 combo, while he was at home with a J-pole built for 6m. It may have been his J-pole or my ATAS, but I would have thought the gain would have been a little higher.

IMHO, 2 meter SSB with a hi-gain antenna (as per Tom KD4WOV) would be the winner here. We all know the ATAS-100 is a compromise antenna. I have the Diamond SG2000 2 meter monoband antenna, at 5.2 db gain I can echo Toms sentiments that it really gets out. It's not for everyone though, at over 62 inches in length. But if you're in wide open spaces (with the odd canyon thrown in for interest), I think it'd be a hard combo to beat.

# 12427. RE: [FT100] Best Mobile to Mobile Bands?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-18 13:54:18 UTC
From: Robert Gauss
Topic: 12372  Message: 12427

I've been reading this thread for a while and it is interesting. Ill add a couple of comments, some based on theory, some practical

- Propgation loss between unity gain antennas goes up with frequency. So comparing 10, 6, 2 meters each using 1/4 antennas 10 would be better than 6, 6 better than 2.

- Propgation loss using equal capature area antennas, example both using 5/8 wave on 2 vs both using 1/4 wave on 6 goes, down with increasing frequency. This might slightly favor 2 if both stations were using well tuned gain antennas and the path was mostly clear. Not the situation presented. I have also seen little practical difference between 5/8 wave and 1/4 wave antennas in normal installations. I believe the limited ground plane of the car roof negates the theorical gain of 5/8 wave antennas.

- Lower frequencies have less shadowing affects than higher frequencies. The local PD finds low band FM better than 450 in hills and valleys here in Ohio

- 10 meters and lower may have QRM problems if skywave propogation is present. 10 is a big band and a clear frequency higher in the band could be used. There are no clear frequencies on 20 hi.

- The FT-100 is 100w out on 6 and 10 but only 50w on 2.

- No arguement that SSB is prefered to FM for range. Primarly due to the narrower bandwidth which improvess S/N on weak signals.

My best bet would be 10 or 6 SSB, using the ATAS antenna, possibly using 2 FM when close for ease of tuning. Lower than 10 is inviting QRM problems and possibley reduced antenna efficency. The ATAS should be nearly lossless on both 6 (full size 1/4 wave) and 10 (small inductive load)

I concur with the views that Lou expressed in bringing out good references to understanding the concepts of zero beating. Also I feel that Paul has brought up a good point, and that's exactly what I tend to do with my FT-100D in order to accomplish that rare DX QSO with the tight filter on and him needing to pull me out of the woodwork. The importance of being directly on frequency with that other contact will always mean the difference between success and failure in a contest, and from where Paul is coming from I would think that Yaesu should provide some type of errata to the operation manual like, "Tone deaf individuals beware of CW operation with this rig" Otherwise the designers of my fine radio (No pun intended) should have thought that Good Operational Features = Good sales for them before making the firmware non-upgradeable or menu buttons that you can't customize. Alpha numeric tags would have also been nice, but who's counting that?? Not to bash anyone on the list but, I think Yaesu needs to take a good zero-beating once in a while. (Pun intended) I'm back in my hole, with my Ft-100D and FT-990AC of course.

# 12430. YAESU'S TURN-TIME ON WARRANTY WORK

Hi all,

The service of Yeasu Europe is very bad.
Send mine to de dealer on November 9 2001 and I am still
waiting.....
The excuse is that they do not have the spare parts.... ( a 50 ohm
resistor can be bought almost everywere in this country) and that
communication between the dealer and Yasu is very bad. They
speak only japanese...

Please give us the particulars on what you are looking to do..
It sounds like you want to tune an aftermarket screwdriver using the FT100 "Tune" feature. Sounds good, but the typical screwdriver uses 12v+ to tune one way and 12v- to tune the other way where the Atas uses two positive voltages to do the same task. I guess you can make an interface by beefing up the driver board (20 bucks from Yaesu) and trying that to interface it. Hard to say as it hasnt been addressed here. Regards.. Richy N2ZD

# 12435. Re: [FT100] Best Mobile to Mobile Bands?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-18 19:51:58 UTC
From: Robert Gauss
Topic: 12372  Message: 12435

Could be activity level. During the 10 meter contest you can hear work many adjacent states after the band closes for skywave. They are weak but stable copy just like 2. Most hams abandon 10 when the band closes.

Could be antenna system. The typical long boom 2 meter antenna may have more capture area the common triband on 10 meters. Achieveabe antenna gain is an advantage of higher frequency operation.

Note that antenna gain and capture area are not exactly the same thing. Capture area is NOT beamwidth. Narrow beam width antennas are high gain and have high capture area.

Example 1:

Pr/Pt = K(for distance)*Gt*Gr*(wl)^2
numbers as ratios, not db
Pr = power received Pt = power transmitted
Gr = gain of receive antenna Gt = gain of transmit antenna
(wl)^2 = wavelenght squared

15ft long two meter beam = 15.8db = 38 times power ratio (cushcraft 13B2)
Pr/Pt = K*38*38*2*2 =K*5776

14ft boom tribander = 8.0db = 6.3 times power ratio (cushcraft A3S)
Pr/Pt = 6.3*6.3*10*10 = K*3969

2 meter advantage = 5776/3969 = 1.6db

And arguable its easier to put up a 15 ft 2 meter beam antenna than a 14 ft tribander. Put up a quad of 2 meter beams (weights about the same) and now 2 meters has a 7.6 db advantage.

Example 2:

10 meter ground plane vs 2 meter gound plane

power ratio both = 1.64

Pr/Pt = 1.64*1.64*2*2 = 10.7

Pr/Pt = 1.64*1.64*10*10 = 269

10 meter advantage = 269/10.7 = 14db

Clearly nearly similiar antenna sizes (capture area) give about same results, or even favor the higher frequency.

Antennas with same gains (but of course the 2 meter antenna is smaller) show a large lower frequency advantage.

> because of the lack of a good RF ground. I just killed the coax in

The CQ-5M quick disconnect mount can be modified for good local ground. 2 methods come to mind. Pay attention to the junction between the thin coax and the thick. You can either:

Take a metal grommet, and screw the junction to the frame, kind of a "O_^_" looking thing with the joint inside the "O" and the "^" representing a screw head or

take a wire and wrap it half a million times around the junction and ground the wire after insulating it against the elements.

Thus, your mount and antenna is never more than a few short feet away from "ground" on the car.

Not really a great solution... SPAMmers always change their "from" identity
every time.

The moderator COULD approve every person joining, by verifying the callsign
of the prospective member. A pain, but I may have to do it on FT817 and
FT817-commander... what a drag

Pres Waterman
traveling... much delay in catching messages,
sorry if I reply and others have already
and I lost many many emails in a crash also!

# 12453. ATAS - no match on 40

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-19 14:47:24 UTC
From: w1pa
Topic: 12453  Message: 12453

My ATAS will hit consistantly on all other bands (including 30, 17, and 12), right down to one segment on the SWR meter, but will not tune on 40m (not even a dip). I tried a longer whip to no avail.

Suggestions? Better grounding of the mount?

Bill
W1PA

Naw, I'd rather find a solution. I think the ATAS strikes a good balance between size (especially on a car), automation, XYL-appeal and performance. I'm not looking to work DX on 40, I just need to work some friends in a two or three state area during my commute.

Yeah, it has some quirks... yes, I have a small spring in my SO239 to make sure the center pin makes contact. Yes, I have changed out the controller board at least once. Yes, I can take an ATAS apart and put it back together like a soldier cleaning his firearm. But I'm having a lot of fun with it.

So, any ideas?

Can't emphasize enough the importance of good grounding and bonding of the antenna, radio and body panels. I had to bond the mount to the trunk lid and the lid to the car for it to tune properly on 40.

# 12457. F100D and DK3 on one cable?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-19 21:35:45 UTC
From: w1pa
Topic: 12457  Message: 12457

Can anyone think of a reason why you couldn't let the 100D tune a remote mounted DK3 using the K5MOG circuit...

http://groups.yahoo.com/group/FT100/files/Documentation/FT100_DK3%20Controll%20Circuit/ft100-dk3.JPG

...AND a couple of SGC DC isolators (used to power remote tuners over the coax) and have everything run off the coax only? I think the only restriction would be that you would need a second power supply for the antenna, since you would be flipping from +12 to -12V. If so, can anyone think of a failure mode that would put 24V (the additive effect of both supplies) across the rig (and smoke it)?

Just thinking out loud...

Bill
W1PA

from the SGC website:
DC Coaxial Line Isolator (for all SGC couplers)
$95.00
Catalog #54-70
This device allows up to 25VDC @ 1.5Amp to be supplied more than 150 feet via the RF transmission line to provide DC power to antenna couplers, antenna switches, pre-amplifiers or other DC powered equipment at the antenna end of the line, eliminating need of separate power cables to supply these devices. This compact unit measures 3 X 2 X 1.6 inches. Two isolators required per installation. Broadband Isolators provides better than 80Db isolation between the RF power on the coaxial feedline and DC power being remotely supplied on the same coaxial line.
RF In/Out to DC port isolation:
Better than 80 Db, 1.5 MHz thru 30 MHz
Better than 70 Db, 30 MHz thru 50 MHz
Better than 40 Db thru and exceeding 250MHz
RG-213 coaxial cable recommended for distances over 100 feet. Power supply for remoted equipment, not supplied. Price indicated is for two units as required for each installation.

# 12461. FT100D no audio after transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-19 23:58:08 UTC
From: w1pa
Topic: 12461  Message: 12461

Just got home from my afternoon commute... tried to work a JH1 on 10m, and the PW0T pile-up on 15.

On a few of my 10m calls, and one or two from 15, the rig would not return from transmit. As I disegage the mic switch, no red transmit LED, no power indication, but no audio. A few quick clicks of the mic, and it's back.

Do I have a sticky relay, or is this the dreaded SWR/Oscillation issue?

This is a 1F series 100D with the SWR mod.

Hey Bill.....Had the same thing happen to me after Yaesu "fixed" my 100.
I took the mic apart and used a sparing amount of high grade gun grease
(it has teflon & graphite in it) and applied to the PTT switch anywhere
it might encounter friction. Worked for me.....Paul, KD5KCZ

Does the green led come on? I've been fooled a few times switching from FM back to SSB and the squelch circuit is right at threshold and sometimes opens on band noise, sometimes not. Be sure squelch is fully open on SSB.

When squelched the rx/tx led is off, when open the rx/tx led is green on receive, red on transmit.

# 12464. ATAS Antenna mount problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-19 17:58:08 UTC
From: K.C. Ross
Topic: 12464  Message: 12464

I use a CQ-5M with my ATAS-100 and initially had a difficult time getting
a good
ground. Took care of it by making a small grounding strap made from the
shield
of some RG-58. one side went to frame while the other side goes between
the
mounting plate and the antenna mount. Takes me 30 seconds to lay the wire
on the
plate and lock down the mount. I've been doing it this way for 2+ years
on 2 different
cars without a tuning problem.

a Comet quick disconnect antenna mount with the "small" coax, I have
trouble with 6 meters and know that the removable part is the problem
because of the lack of a good RF ground. I just killed the coax in
>
The CQ-5M quick disconnect mount can be modified for good local ground. 2
methods come to mind. Pay attention to the junction between the thin coax
and the thick. You can either:
>
Take a metal grommet, and screw the junction to the frame, kind of a
"O_^_"
looking thing with the joint inside the "O" and the "^" representing a
screw head or
take a wire and wrap it half a million times around the junction and
ground
> the wire after insulating it against the elements.
>
> Thus, your mount and antenna is never more than a few short feet
> away from "ground" on the car.

As a matter of fact, "spamassasin" just bounced a genuine FT100 post
recently ( I think.. it squashed something and then proudly reported it had
done something to something... ) based on rules such as "header too long"
and too many recipients... bottom line is it had not done it properly.

Bob,

Ahhhhh-haaaa!....very good idea, since I use the rig for both my VHF/UHF and HF mobile. I completely forgot about that. Since I was working the PW0T on split, he was the only signal and just above the noise so there wouldn't have been much to break the squelch if I had it up a bit (left over from 2m FM), unlike the din 10Kc up.

The green light definately did not come on. I'll check the squelch setting on my commute in tomorrow, and if not that, check the mic. This is one time I am hoping it is just dumb operator error.

Thanks all.

> Won't tx on most of the USA ham bands..

It is a lesser-known fact that Japanese domestic radios are hopelessly locked to prevent TX except in the 144-146 and 430-440MHz bands, which ARE US ham bands, just not the most popular halves. Been this way for lo, 6 or more years? They are called "J-Mark". But I betcha that dawg'll get cellular just fine!

US models are far more forgiving on TX out of band mods, but you can't receive cellular.

In Japan, the radio hackers caused problems TXing where they shouldn't, in the US they eavesdropped on politicians. Priorities.

Try running out a couple of wires cut for 40 mtrs out
from the base (from the point of attachment to the
car) as ground planes. Might be a little harder to
load but the signal should be better.

Bill,

You can go into the F menus and adjust the SSB squelch so that it is always open in relation to the FM setting, that way you do not have to keep adjusting it when changing from FM to SSB. I don't remember which F menu item it is but when you see the SSB squelch setting just adjust it for a higher number while receiving in SSB with the squelch at is optimum FM setting, alter the adjustment until you hear the SSB background noise and then adjust it about 7 to 8 higher. As I remember mine is close to 30.

# 12474. Question about FT100D Fans

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-20 20:09:17 UTC
From: ki5mp
Topic: 12474  Message: 12474

Hello all.

I have two questions regarding the fans on the FT100D:

1. Is there a readily available replacement for the FT100D fans? They look like common computer CPU fans. One of my fans sounds like it is about to 'bite the dust' and I'm not sending it back to Yaesu for a simple replacement. If one is not available locally, has anyone ever ordered one from Yaesu? Price?

2. My FT100D is a 1H... serial number rig purchased just before Christmas and has the factory installed SWR modification, but no thermal sensor for the fans. In addition to HF, I work quite a bit of VHF, so I did the "resistor to ground" mod for one of the fans. Well, only the fan whose black wire I chose to cut (the one closest to the bulkhead) comes on at low speed when you power the rig up. This makes sense, but I guess I had assumed from all the postings that BOTH fans would run at continuous low speed after the mod. Is this normal behavior? I guess one fan running continuously is better than none at all, huh? I could always do the same mod for the other black wire...

Thanks,
Mike, KI5MP

I believe the fans are just garden variety 12V fans
that are available in standard sizes. You could
probably substitute anything that would fit. Cooling
fans are available in 20mm increments, i.e., 40, 60,
and 80mm sizes. The 80 mm fan is the familiar size
you find in computer power supplies. I haven't
measured the FT100 fans, but my guess is that they are
standard 40mm (square) fans.

Unless Yaesu has changed the layout of the PA board,
the fans are connected in parallel. You might want to
check it out and see if this is still true.

In my own experience in trying to quiet fans, the
*only* thing you can do to quite a fan is to make it
run slower. Of course, this means less air to cool
the things that get hot, so you have to be careful in
how you apply this technique. In an optimized
situation, fans will spin fastest when the heat
generation is highest and slower when heat generation
is lower. That's the way the FT100 is intended to
work. Transmit generates at least 10 times more heat
than receive so you can reduce the fan speed
accordingly to achieve a safe temperature rise inside
the case during receive.

Yaesu evidently believes that on V/U recieve, the fans
can remain off and the temperature rise inside the
case will not be a problem. My guess (and I have no
insider knowledge on this) is that they opted to
thermostat the fans on HF to minimize drift, which
generally isn't as important on V/U recieve.

Topic: 12474  Message: 12476

Thanks for the response, Lee. I'll try to find a replacement locally and take a closer look at the schematic. I've had no problems whatsover with the rig at this point - just trying to prolong any future agony... :-)

Thanks again,
Mike KI5MP

Mike,

This might be your problem...you should not cut any wires....only add
the resistor IN PARALLEL to either black fan lead.

You are not supposed to cut the black wire,just jumper between
the black wire and ground with a 50 Ohm resistor.

Why don't you do what I do, set up your email program to automatically put the emails in, say, a FT100 folder and then go and look at it when you have the time. You can normally do this by setting up a rule for the program to follow.

From: Eric van de Weyer
Topic: 12474  Message: 12483

Hi Mike,

the idea is not to cut any wires but just put the resistor from one of the black fan wires to ground. I acrually did a bit of tracing on the board and found a place where I could just solder the resistor between a ground trask and a track feeding the negatrive fan leads.

The two fans are connected in parallel with 12V supplied permanently to the positive leads and the switching done in the negative leads.

The problem with what you appear to have done is that now only one fan will run at full speed when you transmit with the other only running at low speed as set by the resistor. This will probably not give sufficient cooling when you are transmitting.

I suggest that you re-connect the fan wire you removed and then install the resistor and both fans will then run.

What you could possibly do is to take out one of the fans, preferrably the one which is noisy, and take it with you as you go in search of a replacement. You are probably correct that a CPU fan may be a suitable replacement. Otherwise, you should be able, I would think, to get one as a spare from Yaesu/Vertex.

My FT-100D purchased Jan 14,2002 Has quit receiving intermitingly on 2met and 440 One time it works and the next time it dosen't. I receive only white noise as if the squelch is off. There is no audio, even when I transmitted with a hand held 2 meter next to the radio. One time I was listening when it wasn't working and the white noise suddenly got a little louder. Then I heard the repeter key up and it was working again. It worked all day yesterday. Doe's anyone know what caused this? donkn5i@...

# 12485. Re: Question about FT100D Fans

From: k5unm
Topic: 12486  Message: 12486

For what it is worth......

Finally got the FT100 back from Cerritos (12-3-2001 till 2-13-2002,
does not include transit time)
Repair items:
1 each G3090124 SRF7043 transistor 200.55
1 each K33279021 22pf capacitor 1.47
1 each K33279038 39pf capacitor 1.47
1 each K33279020 12pf capacitor 1.92
1 each A08980017 WSH6 n/c
90 minutes tech time 105.00
Tax 13.36
Shipping 10.52
They (YAESU) had a declared insurance value of 1689.00 for UPS,
guess that would cover a FT100D with all filters and options?

It does have all the mods installed including the thermal switch, I
did also add the 51 ohm resistor across the switch terminals to
provide low speed fan operation.

I researched the fans extensively and found the best "fit" in terms of DC current requirement, CFM rating and noise rating. I found a fan that had a greater CFM rating but a much lower noise rating. The current requirement was equal or less than the original fan. Don't recall but I know the current rating was not greater than the original fan. My whole motivation for doing the change was to try to reduce the noise. What I found was that the fan noise is not due to the cavitation noise nor the general operational/mechanical noise of the fan itself. Rather the noise is primarily due to the air movement through the rig. If there was less restriction in the rig it would quiet down considerably. I think it is slightly quieter now with the new fans but not much.

Anyway, I can give you the make and model number of the perfectly compatible fans. I'm at work but I'll get the number tonight. One thing though, you will have to splice on the old connector from the existing fan. You can buy the fans from Jameco Electronics. Check out their website. Don't put in any arbitrary fan. It must be matched in terms of current drain and CFM rating.

I have some "deeper" fans that will stick out the back about a half inch that I haven't tried yet. Maybe they'll be a bit quieter but I doubt it.

That info from Jameco would be very much appreciated, Chas. As mentioned, one of my fans sounds like it is about to quit on me. When I first power up the rig, it buzzes and whines and turns at an inconsistent speed until finally it "warms up" and sounds normal again. I've had a couple of computer CPU fans do that exact thing before they finally died...

Thanks,
Mike KI5MP

Topic: 12474  Message: 12489

Just rejoined the group after a prolonged absence of 3 years.
My FT100 (early model) is now out of warranty and had to be
returned on a number of occasions for repair. Recently my
VHF/UHF output dropped to QRP. I'm guessing that this is due to the heat
issues.
When it is repaired I shall add the fan control modifications and
check/add the earth bonding modifications for SWR stability. I'd just
like to hear comments from anybody who has suffered
a VHF/UHF failure. For instance was the problem that the SRF7043 had
blown up?
Looking at a previous post I see a new device was 200 USD. Ouch! In the
UK it may be even more I guess.
Has anybody mended the radio themselves after suffering this problem?

The most recent word on this list is that they are not imported into the USA, it would take a $1000 order through a parts broker to get some. I've not looked really hard but I've not found an mechanical thermostats as small in US makers or with as low a temperature.

I've suggested a transistor circuit with a positive temperature coefficient thermistor once before.

Last night I was reading through a new MAXIM mailer on temperature sensors and they featured a couple pages of FAN CONTROLLERs in very tiny packages, good for a quarter amp fan up to 12 or 24 volts (depending on the model). I looked in the Digi-Key web catalog for the chips but found nothing this morning. Unfortunately they are factory set to a trip value, so there's many varieties and they may be as hard to acquire as the Tokin thermostat. Look for: MAX6665ASA40 (that last 40 is temperature in degrees C). MAXIM is very good about offering engineering samples.

I called a couple of their distributors a while back and found that they are considered a semi-custom part, so finding some in a bin somewhere is nearly impossible, unless it is a surplus or a cancelled order, etc. Yaesu is your best bet.

I've been sitting here listening to the fan in my IBM laptop cycle on and off for the better part of the afternoon. There must be some alternatives out there (including the Maxim part).

# 12495. How does the 100D do on FM broadcast bands???

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-22 01:52:22 UTC
From: recurve95
Topic: 12495  Message: 12495

REALITY....
I am considering getting the 100D in order to satisify my long desire for a decent SWL rig in the car. Anybody doing any SWL'ing? For those of you using it, how does the 100D do reception wise and audio wise on the FM broadcast bands (88-108)? Strange questions I know, but I enjoy listenting to other stuff just as much, if not more, than talking "ham stuff".

DREAMING....
I have always thought that the best mobile rig would be a radio like the 100D with its capabilities, but in a size that would "drop right in" to the factory space for the AM/FM stereo. The 1.5 DIN size stereo in my Silverado is HUGE compared to the size of the 100D. I know it can be done. I dont know how many hams drive GM or Chrysler products, but at hamfests around here, the percentage is pretty good. I bet Yaesu could sell a bunch of radios designed this way.

EVEN MORE DREAMING....
Yaesu, Icom, Kenwood LISTEN UP.
Design a wide band, general coverage HF/VHF/UHF transmitter (like the 100D)
that that does all the ham stuff AND has good FM reception in STEREO, so I can rip the AM/FM stereo out of my truck, car or whatever I am driving, and put the 100D in its place. Have enough audio out to drive the door speakers already installed in the vehicle. The seperation kit is great, but make a blanking plate so I can remove the stereo, and put a 100D faceplate in there. It shure would make the installation look professional and not end up with radios everywhere. I am seriously considering doing just this in my truck if the 100D has even average FM reception and audio quality. Dont think I havent been looking for a good canidate for a blanking plate that would look good.

Sorry for the dreaming...just got wound up with the possibilities I see!!!

It works great Rxing there,you have to make sure that you're useing FM wide.If you play with the DSP a little bit you can use it for Bass and treble controls.

Sounds like you may have a loose connection inside. Just open it up and carefully re-seat all connectors and seer if that fixes it.

Subject: [FT100] FT-100D receive on fm

My FT-100D purchased Jan 14,2002 Has quit receiving intermitingly on 2met and 440 One time it works and the next time it dosen't. I receive only white noise as if the squelch is off. There is no audio, even when I transmitted with a hand held 2 meter next to the radio. One time I was listening when it wasn't working and the white noise suddenly got a little louder. Then I heard the repeter key up and it was working again. It worked all day yesterday. Doe's anyone know what caused this? donkn5i@...

Hello all.

I bought a new FT100D last Saturday 16/02/02 in the UK. it was returned to the store and replaced on Wednesday.It suffered from a VERY noisey fan and on 70cms it was off frequency.The new one is better. Anyone else having these problems. hats mr Yaesu up to?

also is it possible to down load the ADMS software for the Yaesu VR500 anywhere

Regards to all

Chas (G4WIE)

Yup, I've got a new Dell Latitude C810 laptop that the fan cycles on/of
with great regularity. I just ignore it, but I still hear it.

# 12501. My FT100 failure?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-22 19:04:18 UTC
From: pa9jj@amsat.org
Topic: 11774  Message: 12501

Hello all,

I just discovered the malfuction of my FT-100 after several hours stand-by on HF.
After a while the s-meter indication (observed on the commercial broadcast band) would drop from S9 - S nothing.
I then turned the rig off, waited about 3 seconds and turned it on again and there was the S-meter indication, but after say 10 seconds it dropped down to nothing again.
So I decided to put the rig on a 12 V. accu. And then the problem was no longer there.
I was using a SEC 1223 from Semlex as my power supply. The output voltage was 13.8 V.
What I did is put the output voltage from the SEMLEX down to 12.6 V by turning VR2 (could not get it lower).
And now the problem seems to be gone and the FT-100 is still giving 100 Watts on full power.
But the thing I do not understand is why the operation on 13.8V ( being the power supply according to the manual) will not work.
Could this be re real problem??

If someone has the same experience I would like to know.Best 73's

Jan,

This has happened to me and at several other list members. Here's an earlier message I sent to the list when I got mine back from Yaesu after they repaired this problem. Also attached is a description of the problem by other list members. I don't know if this will help you, but it looks as if it's got to go back for repair.

73 and GL,

Doesn't sound right. I've run my D on a Samlex 1223 for many hours
with never a problem. Sounds like the over/under voltage protection
circuit window is set too tight on the high end.

Topic: 12495  Message: 12505

I use my FT100D quite a bit for swling. Have about two dozen freqs programed in for when Art Bell is boring at nite. Wasn't real happy with the WB FM commercial band but didn't think about using the menu to adjust as advised by others. Audio tends to be alittle weak but most of time I am able to hear all the words even though I am in a diesel big rig. BTW, has anyone tried using the 100 on 220 after the freq opening mod? That would be another reason for doing the mod. As I recall the Japanese do not have 220 which is why most of their radios do not have the band installed.

From: Mike May
Topic: 12502  Message: 12506

I just looked at my schematic and the only parts that I can find with the A0898xxxx designator are the crystal filters in the second IF, unless someone else has a parts list which could shed light on this but it seems to reason if the xtal filter is bad the sensitivity and the rx audio would drop out. A good check would be to change modes say from SSB if this is when the audio drop occurs then go to AM or FM and see if audio comes back. Anyone have a service manual who could check and tell us what the A08980048 part is ?

This sounds suspiciously like a problem of oxidation
on the contacts of the tx/rx relay.

Does it go away if you transmit for a moment?

Ok here's the fan info. The company's called "Jim-Pak" now but
they're at the same location near my work. The part number is
161699. That's their internal part number for the fan.
It is Fan 12 VDC, 6.5CFM 1.60 x 0.4 inch about $6.95 each.

Hi,

No you are right. It is not the power supply. I guess I tested it not long enough.
But you know, my own FT-100 is for repair for this problem at Yeasu Netherlands and they have send me another FT-100 which I can use as long as the repair takes, but this one has exactly the same problem.

From: John Hirth
Topic: 12502  Message: 12511

Before the "deaf Rx" problem was fixed in my 100D the only thing that would bring the receiver back to "normal" sensitivity was momentarily powering off/on. It would then be OK for another few seconds before again becoming "deaf". A quick transition into transmit and then back to receive had no effect on the problem. Neither did switching modes... in my case it was evident in SSB, AM, FM.

I can't speak for Jan, who most recently reported the problem in his rig.

The law of odds has it that there is something wrong with your power supply. 2 out of 2 is unlikely on this one. So if you have an oscilloscope I suggest that you take a close look at what's going on on your input DC line when the "problem" occurs. Often you don't see the whole picture if you just base your voltage measurement on a simple voltmeter. That Samlex may have a transient voltage spike or something else. Snoop it out and you should see what's up. Remember, until you truely understand the root cause of a problem it's not corrected, even if it "goes away" for a while.

From: pa9jj@amsat.org
Topic: 11774  Message: 12514

No it is not the power supply. Even when I use a car battery this
problem occurs. But I am almost sure that it has something to do
with the overheating of the rig. When I use my room van and put it
on top of the opened rig (the upper side, were the speaker is) then
the audio and s-meter indication comes back again.
Remember, this FT-100 has no modifications yet.
So I will first buy me a 50 Ohm resistor and do the ventilator mod.
Hope this will clear a lot.

Mike; the only thing I can find in my ft100 service manual is a
"MFR'S DESIG" to A0898 as a "WIRE ASSY" (A0898 #241896) in the Local
Unit.
Not much help sorry.

On the bill I just got from YASEU the modification to add the Tokin thermal switch was A08980017. This would imply that A0898xxxx sequence was the various modifications and no charge changes to the radio. I would suggest that all who have had their radios repaired add the corresponding numbers for the SWR, and other mods.
A08980017 Tokin thermal modification
A0898xxxx SWR mod
A0898xxxx ?????

# 12517. Re: A08980048

The A0898XXX must be accessories or available mods as the optional
2nd IF crystal filters have the same reference designator.

# 12518. Here's a new problem!

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-24 02:36:26 UTC
From: barry_zoll
Topic: 12518  Message: 12518

I just got my FT100D back from Yaesu. The good news is that they did the thermoswitch, swr, am update but now the rig has a new problem. I've been getting audio reports stating that I'm overdriving the mic. I've set the gain down to 15 with a little improvement. The battery voltage in my truck is 14.5 running and 12.6 at rest. I hold the mic about 10 inches from my mouth.

I was snooping around the power cord and found that the negative pin came out of engagement from the connector I used but the radio still was on. I use a 3 magnet mag mount with Ham Sticks and the mag mount is grounded to the frame of the truck. I discovered that the 12VDC was flowing through the ground side of the antenna coax then to the fram of the truck. When I removed the antenna ground, the radio shut off. I plugged it back in to the power connector and it worked ok. I had a QSO with one guy and he said that my audio was ok. If I place a gound wire on the back of the radio, my output on 20 meters drops from 100 to 50W. I should have bought a 706 MKIIG.

Any suggestions before I get ahold of the President of Vertex Standard?

Thanks and 73.

Hi Barry,

For VHF and UHF sometimes the capacitive coupling between a mag mount and the sheet metal is enough but not for HF. It is best to attach a low impedance ground from the antenna base to nearby sheet metal. If it is on a hood you usually need to add straps between the hood and rest of the sheet metal too. Use at least a 1/2" wide straps or braid and make them as short as possible. They way you have it now, you ground the mount to the truck frame and then, somewhere, the frame attaches to the body with a few straps. When you ground the rig inside the cab you get a big loop and it's not too surprising that funny stuff is happening.

And, before getting that 706, consider a TSB2000 instead.

Go back a few weeks in the list and you will find where I was complaining about an audio problem similar to yours. I am on my second FT-100D. The first was returned after a couple of weeks because of the SWR problem (it had good audio though). The second one does not have the SWR problem but people complain that my audio is too hot and that it sounds like I am over driving . Turning the mic gain reduces that amount of audio but my reports still say that it sounds to hot and over driven. I talked with Yaesu and they faxed me the alignment procedures which I read and then filed away because it was very involved and I no longer have the required equipment to perform the alignment. The only fix I can come up with is to do what most people said and don't talk directly into the three small holes on the mic. I now either talk into the buttons or I speak across the mic. I hate to have to change my habits but that is the only way short of returning it to Yaesu for 5 to 12 weeks. Good luck with yours and let us know if you come up with a better fix.

FT-100(D) fans.
I have been reading the mail regarding the fans in the FT-100(D) and N6AF mentioned that a substitute is available in Jim-Paks. That triggered a thought and I went to Google on the Web and typed in the word Jim-Pak, and I found the web site www.jameco.com and they list that exact number quoted along with 98 other fans also! The #161699 is on about 6 or 7 pages along the list but it is there. Give it a try, they seem to be willing to ship to individuals also. Just a thought as not all of us have a store that stocks these items locally. Worth a try.

Not so fast, Barry.

First, make sure that the power connector actually connects both leads to the battery. Who knows what was going on when the mag mount ground connection was acting as your ground return to the battery.

As far as the output going down when you grounded the actual rig, no doubt the whole antenna impedance is now different than it was before you changed the ground point. Everything has changed! Heck, probably the output is down because the antenna is now off resonance and the audio "overdriving" could be RF feedback getting into the audio circuit. Lots of possibilities.

I've found that you've GOT to get the antenna system solid first, which includes grounding the rig and antenna base to the frame. Then go about changing the antenna to match the freq either with inserting the proper hamstick or using the longest one and popping a tuner in there to get the antenna to resonate. You'll probably find that the audio will clear up.

Trial and error is the only way I found all of this out. It has worked for me and by looking at other postings here, others have had similar success. Good luck.

Sometimes you have to go the edge to really see what's there.
I almost bailed today. Last ditch effort was done tonight after
dinner. My wife and I operated on the patient and the surgery was a
massive success! My anger was with regards to the generally
restricted "muffled" transmit audio that is common and unfortunately
normal for all FT-100 and FT-100D rigs. I followed Richy's advise and
modified the mic. Amazing result. There's another guy in Redding
that's going to do it tomorrow. Richy suggested turning the "baffle"
that's in front of the electret element. I went a step further; I
took the dang thing out completely! Then my XYL jammed a needle
through the 3rd hole that's blocked in the stock mic and voila, done
deal. Just great. I was on my way out. This rig is like a turbo
Porsche with a restricted intake. I opened it up. Now it sceams.
Not for sale now. Not a chance.

# 12534. CAT cable schematic ? ( level converter cable)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-25 05:44:55 UTC
From: n7bfs
Topic: 12534  Message: 12534

Well , I am at a point where I want to start playing with my '100d with the CAT commands , and lo and behold I have found that they missed the mark (they figured it out on the FT847 ) and left the RS232 level converter out of the radio and require you to buy it :^P

So , since I already have a CAT cable for my FT8500 I was wondering if anyone has the schemagram for the CAT cable for the '100 , and if I can make an adapter cable , then I won't have to buy two CAT cables , just to talk to both radio's ..

Any ideas ?
Thanks for any input :)

I think it's fixed! I found the ground wire on the power cord disengaged and repairing that and changing some menu settings, I'm back in business. Thanks to all for your support. 73

# 12538. Full power and Processor - Help

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-25 12:44:00 UTC
From: py2mrd
Topic: 12538  Message: 12538

All, is there applying full power (150W)and this porcedure could damage the rig ?

And regarding Processor, a lot of friends of mine have only bad reports using it. Is it normal ?

Tks

I've seen this problem with commercial 2-way radios when the negative lead becomes disconnected. The DC is carried through the coax shield to the radio because most radios are case ground. Sometimes the current is high enough to melt the coax.

But to keep a answer from being beat around a bush....The answer to your question is:
Yes you can build a adapter.
I use my w32 programming cable for programming my 8500 (adapter built) and CAT for the 100.

Realize that the PROcessor control does not adjust the compression percentage. That is set at the factory. I checked this with an oscilloscope myself. The "PRO" level setting is just an independant MIC GAIN setting that over-rides the regular MIC GAIN setting whenever you have the PRO enabled. You can prove that to yourself by turning on the PRO, setting the level "within" the PRO button to about 65 in SSB and then going to the standard MIC GAIN control and setting it to ZERO. You will still have normal mic level.
The PRO works OK on the FT-100D, not great, but it helps sometimes for DX. I use it sometimes on AM operation. The trick there is too never set the PRO level (when using PRO) or the MIC GAIN control (when not using PRO) higher than about 17 or so. Also, for a bit more linear AM operation on peaks, set F15 (for HF) so your peak output power is around 125 Watts, rather than the standard 100 Watts. In CW mode though never run above 100 Watts; unless you like the idea of an early grave for your final amp devices.

If you want excellent audio with the FT-100D you have to operate on the stock mic. Remove the plastic "baffle" that's in front of the electret mic element and also open up the 3rd tiny hole in the front of the mic. People won't believe you're using an FT-100D. That mod is courtesy of Richy. But I believe he has abandoned ship and gone over the the TS-2000 world.

First of all, realize that 150 Watts vs 100 Watts is only 10*log(150/100) = 1.76 dB which is very little return in added fade margin for a likely big increase in heat so it's a lousy trade-off. 6 dB is one S unit so the 150 Watts buys you nil. The only time I recommend cranking up F15 is during AM operation and that's just to give the PA a little more headroon on peaks. Actually if you can "train yourself" psychologically to run 75 Watts without feeling like a wimp, you will find yourself getting virtually the same success as 100 Watts since you're only down about 1.25 dB. On SSB set the MIC GAIN (or PRO gain if PRO is enabled) to 65 and talk in a very slightly elevated voice about 4 inches from the mic. You have got to get that stupid plastic baffle out of the mic to make your rig come alive. It's an amazing improvement. Believe me. I just modded mine. Once you have the mic modified you can experiment with the MIC DSP settings. You will probably find the you want it on setting "2" since that gives you the mid-range frequency emphasis. But there's a little trick with the MIC DSP when you're running AM with the PRO enabled. Now you will probably want to set the MIC DSP to setting "1" which helps to take the harsh edge off of the processor effect. Unless you're contesting DX; then leave the MIC DSP on setting "2" or just turn it off. Let me know how you do with the mic mod. I just don't hardly believe Yaesu made such a big compromise with that "wind baffle" but they did. It's like driving a high performance sports car around town with the emergency brake half pulled on! Get that "brake" out of there. Let me know how it works out for you. 73's N6AF Chas --- In FT100@y..., luiz lissoni wrote: > Tanks man ! > > I really think this rigs is a rare jewel but it´s very > difficult to get good reports. Hi ! Tanks again and I?ll try it today. In spite of the dB formula, in the real world, actually yesterday, with 100 W I got a bad report (bassy and 5/9), but with 150 W, same day, time, band and antenna it goes to 5/9+20 and some "what a good signal and audio quality !!!". Regarding to the mods, we don?t have Yaesu dealers here, so I didn?t do it yet. I am looking for a step-by-step in order to do by myself. I?ll let you know the results. 73 --- backhoefade wrote: First of all, realize that 150 Watts vs 100 Watts is only
10*log(150/100) = 1.76 dB which is very little return in added fade
margin for a likely big increase in heat so it's a lousy trade-off.
6 dB is one S unit so the 150 Watts buys you nil.
The only time I recommend cranking up F15 is during AM operation and
that's just to give the PA a little more headroon on peaks.
Actually if you can "train yourself" psychologically to run 75 Watts
without feeling like a wimp, you will find yourself getting virtually
the same success as 100 Watts since you're only down about 1.25 dB.

On SSB set the MIC GAIN (or PRO gain if PRO is enabled) to 65 and
talk in a very slightly elevated voice about 4 inches from the mic.

You have got to get that stupid plastic baffle out of the mic to make
your rig come alive. It's an amazing improvement. Believe me. I
just modded mine. Once you have the mic modified you can experiment
with the MIC DSP settings. You will probably find the you want it on
setting "2" since that gives you the mid-range frequency emphasis.
But there's a little trick with the MIC DSP when you're running AM
with the PRO enabled. Now you will probably want to set the MIC DSP
to setting "1" which helps to take the harsh edge off of the
processor effect. Unless you're contesting DX; then leave the MIC
DSP on setting "2" or just turn it off.

Let me know how you do with the mic mod. I just don't hardly believe
Yaesu made such a big compromise with that "wind baffle" but they
did. It's like driving a high performance sports car around town with
the emergency brake half pulled on! Get that "brake" out of there.
Let me know how it works out for you.

You must be talking about the spurious oscillation and VHF/UHF fan mods. I was referring to the microphone modification which is something that Yaesu doesn't do. You will eliminate the "bassy" sound when you modify the microphone.

Topic: 12538  Message: 12549

Let's apply a little science here can we? A 20dB signal increase would be the same as going from 100W to 10kW !!!! If you drive the PA at 150W you will likely be spreading badly on the bands and shorten the life of the PA. Cliff, G4PZK -----Original Message----- From: luiz lissoni [mailto:py2mrd@...] Sent: 25 February 2002 20:07 To: Cliff Bryant Subject: Re: [FT100] Re: Full power and Processor - Help Hi ! Tanks again and I?ll try it today. In spite of the dB formula, in the real world, actually yesterday, with 100 W I got a bad report (bassy and 5/9), but with 150 W, same day, time, band and antenna it goes to 5/9+20 and some "what a good signal and audio quality !!!". Regarding to the mods, we don?t have Yaesu dealers here, so I didn?t do it yet. I am looking for a step-by-step in order to do by myself. I?ll let you know the results. 73 --- backhoefade wrote: First of all, realize that 150 Watts vs 100 Watts is only
10*log(150/100) = 1.76 dB which is very little return in added fade margin for a likely big increase in heat so it's a lousy trade-off.
6 dB is one S unit so the 150 Watts buys you nil.
The only time I recommend cranking up F15 is during AM operation and that's just to give the PA a little more headroon on peaks.
Actually if you can "train yourself" psychologically to run 75 Watts without feeling like a wimp, you will find yourself getting virtually the same success as 100 Watts since you're only down about 1.25 dB.

On SSB set the MIC GAIN (or PRO gain if PRO is enabled) to 65 and talk in a very slightly elevated voice about 4 inches from the mic.

You have got to get that stupid plastic baffle out of the mic to make your rig come alive. It's an amazing improvement. Believe me. I just modded mine. Once you have the mic modified you can experiment with the MIC DSP settings. You will probably find the you want it on setting "2" since that gives you the mid-range frequency emphasis. But there's a little trick with the MIC DSP when you're running AM with the PRO enabled. Now you will probably want to set the MIC DSP to setting "1" which helps to take the harsh edge off of the processor effect. Unless you're contesting DX; then leave the MIC DSP on setting "2" or just turn it off.

Let me know how you do with the mic mod. I just don't hardly believe Yaesu made such a big compromise with that "wind baffle" but they did. It's like driving a high performance sports car around town with the emergency brake half pulled on! Get that "brake" out of there. Let me know how it works out for you.

From: backhoefade
Topic: 12538  Message: 12550

Here's the science. In terms of linearity the F15 control actually does allow the PA to run at a higher power level while still operating linearly. Look at the envelope with an oscilloscope and the spectral re-growth with a spectrum analyzer and you'll find that it does very nicely at around 140 Watts PEP output. The only issue is the thermal concern and the peak RF power rating of the devices. It will run hotter and the devices may fail. But there is no increase in "splatter" in terms of IMD. Still, we don't recommend cooking those devices for less than 2 dB of increased system gain. That's a complete waste. What I enjoy doing sometimes is driving my SB-220 with the FT-100D. Now that's a true 10 dB increase and the FT-100 just purrs along. Gotta use a little matching network between the two units but that's a different matter. The SB-220 works well once you've installed the Harbach solid state relay control interface. --- In FT100@y..., "Cliff Bryant" wrote: > Let's apply a little science here can we? > > A 20dB signal increase would be the same as going from 100W to 10kW !!!! > > If you drive the PA at 150W you will likely be spreading badly on the > bands and shorten the life > of the PA. > > Cliff, G4PZK > > > -----Original Message----- > From: luiz lissoni [mailto:py2mrd@y...] > Sent: 25 February 2002 20:07 > To: Cliff Bryant > Subject: Re: [FT100] Re: Full power and Processor - Help > > > Hi ! > > Tanks again and I´ll try it today. # 12551. RE: [FT100] Re: Full power and Processor - Help

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-25 23:44:26 UTC
From: Cliff Bryant
Topic: 12538  Message: 12551

Interesting, so the devices will stand the extra power. I'd be very interested to hear by how much the harmonics increase with the extra power (before the output filter network), the designers usually allow headroom of course.
I completely agree about the thermal concerns.
The questions are thus: Is it worth getting 2dB extra output (As you indicate below, no of course it isn't and the 20dB report is due to conditions or a poorly calibrated meter) and secondly even though the PA can develop the extra power can the output filter and even the output connector handle it? Hmmm I'm sticking to 100W (or less).

Noted about driving the 220 from the radio. I've never run QRO from the mobile (I only use my FT100 in the car) and we are restricted to 26dBW over here in any case. I use an IC2KL in the shack with an Icom radio and the rig is quite comfortable at the lower drive although the amplifier is not the cleanest around if driven hard.

For the record I took my (elderly) FT100 to be mended today. It's the fourth time as I recall and out of warranty. This time the VHF/UHF output had gone QRP. I was on this group when the rig first came out and left it before I read about the fan modifications and thermal switch addition. My rig has always been well ventilated in the car (or so I thought). I've asked them to add the thermal switch and I may add the resistor to the unit.

Have you tried increasing the drive level and if so how high did it go?

Cliff, G4PZK

I agree. I run mine at 100 Watts PEP most of the time. When I run FM on 10 meters I run it at 50 Watts since the rig is thermally sized for 100 Watts rms CW power out at roughly 50% effective duty cycle. So you really have to watch it on HF FM. For HF AM you set F51 for 25 Watts unmodulated output carrier. Then, per AM theory, the peak envelope power is 6 dB (4x) higher than the unmodulated carrier power. So you get your 100 Watts PEP AM that way. The highest I think I've seen come out of this little rig is about 170 Watts. We don't make that a habit - no way. The maximum power out varies depending on the band. Sometimes I run the rig at its absolute minimum output on 40 meter CW. You see about 3.5 Watts output when the power control is dialed all the way down to "zero".

# 12553. Re: NOT for Sale FT-100D/mic mod

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-26 00:01:51 UTC
From: ft100guy
Topic: 12528  Message: 12553

My anger was with regards to the generally
restricted "muffled" transmit audio that is common and unfortunately
normal for all FT-100 and FT-100D rigs. I followed Richy's advise and
modified the mic. Amazing result. There's another guy in Redding
that's going to do it tomorrow. Richy suggested turning the "baffle"
that's in front of the electret element. I went a step further; I
took the dang thing out completely! Then my XYL jammed a needle
through the 3rd hole that's blocked in the stock mic and voila, done
deal. Just great. I was on my way out. This rig is like a turbo
Porsche with a restricted intake. I opened it up. Now it sceams.
Not for sale now. Not a chance.
Yahoo!
N6AF Chas

LOL, I told you guys so!! You thought I was pulling your coax! My
audio was the talk of the town after modding the mic.. Noone believed
it was an FT100. Takes about 15 minutes start to finish but well
worth the time.. Take the sock outta your mouth, mod the mic!!!

For a simulated audio demo see below:

Before mic mod: "A can of peas"...
After mic mod: "73's" (See the difference!!)

# 12554. Re: Here's a new problem!

Knock knock knock... Is this thing on? Do the mic mod, punch out
the third hole and reorient the baffle (or according to Chas, remove
it altogether). You will be amazed!

PS, set the mic gain to 63 and set tx dsp to "dsp1"

Regards.. Richy N2ZD

Subject: [FT100] Re: Full power and Processor - Help

Realize that the PROcessor control does not adjust the compression percentage. That is set at the factory. I checked this with an oscilloscope myself. The "PRO" level setting is just an independant MIC GAIN setting that over-rides the regular MIC GAIN setting whenever you have the PRO enabled. You can prove that to yourself by turning on the PRO, setting the level "within" the PRO button to about 65 in SSB and then going to the standard MIC GAIN control and setting it to ZERO. You will still have normal mic level.
The PRO works OK on the FT-100D, not great, but it helps sometimes for DX. I use it sometimes on AM operation. The trick there is too never set the PRO level (when using PRO) or the MIC GAIN control (when not using PRO) higher than about 17 or so. Also, for a bit more linear AM operation on peaks, set F15 (for HF) so your peak output power is around 125 Watts, rather than the standard 100 Watts. In CW mode though never run above 100 Watts; unless you like the idea of an early grave for your final amp devices.

If you want excellent audio with the FT-100D you have to operate on the stock mic. Remove the plastic "baffle" that's in front of the electret mic element and also open up the 3rd tiny hole in the front of the mic. People won't believe you're using an FT-100D. That mod is courtesy of Richy. But I believe he has abandoned ship and gone over the the TS-2000 world.

Cliff,

You may want to add some transzorb surge supressors to the 13.8 volt dc line coming in to the radio to protect the finals once you get your radio back as my V/U final device blew while I was receiving, I never put the radio in transmit at all when the final died. I was rxing and then I smelled burning silicon, felt the radios side and it burnt my hand. Turned out it was most likely a voltage spike from my car that took the final out, the short was punch thru from drain to gate. I now have 15 volt transzorbs on the dc line coming in and also have them on the bias lines to each pa section. Also I found the stock V/U finals biasing pots scheme leaves a lot to be desired, the Vgs range on my radios V/U stage was 8.5 to 9.0 volts which is at the maximum range for the VHF/UHF finals specs, as a result I changed the configuration of the biasing pot on the V/U final so I could set it to my liking IE from about 2.5 volts up to 5 volts max and so far so good with a new device in there.

Mike

Thanks for this info. For the record I was transmitting when I saw the output drop (a sickening feeling - I was driving in the horizontal pouring rain in pitch black around a scottish loch at the time to complete the picture!). Transzorbs definitely wouldn't hurt I agree. The biasing issue is interesting as well. As I recall they have those really tiny pots on board. I'll take a look at the circuit. This radio is rapidly becoming a kit in some ways.

You've probably already discovered it, but you must also remove the tiny screw that secures the PTT microswitch to the board. There will be four screws altogether that hold the circuit board down. I just completed the mod on mine last night. I'll be interested in what kind of difference it makes, if any. I received excellent audio reports already, but based on what Richy and Chas said, I performed the mod anyway... We'll see... Good luck, Mike KI5MP --- In FT100@y..., luiz lissoni wrote: > I am just opening the mic but it´s very difficult to > take out the board. # 12569. Mic and fan mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-26 18:07:42 UTC
From: John McClain
Topic: 12569  Message: 12569

I just operated on my mic by removing the baffle and drilling out the third hole. I only had one serious problem and there is going to be heck to pay when my wife gets home from work because of it. I BENT her sewing needle while drilling out the third hole. I was never very happy with the resistor/fan mod because it made too much noise here in the shack so I added a second 47ohm resistor in series with the first and now the fan noise is at a more acceptable level. I just hope that it is moving enough air now.

When I put everything back together again, I got on 10 meters and got a very good audio report on SSB. I will be on 10 FM later today where I hope to get some more good reports.

# 12570. Mic plugs and swapping them

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-26 18:53:53 UTC
From: kg4fet
Topic: 12570  Message: 12570

Guys just want pass on this little tid bit of info to you in the group who want/need to build some sort of switch box for your mics that you use often and hate to pull the face off the rig to change them. I use 2 (usually) mics on the FT 100 when I am at home. one is the hand mic, used for casual rag chewing, 2 mtrs nets ect. I use the Heil PROSET 5 for the same reasons plus if I am working on the bench and need both hands or if I am contesting . I swap between these 2 mics a couple of times a day. Okay enough on the back ground of the project here. Now on to what I did and how I did it.

I found a couple of 10 ft 6 wire phone wires in a dumpster down the street where a building is being remodled. This solved the really troubling part of where to get the 6 pin modular connector and not have to pay the 25.00 min order plus the shipping from a parts house. I cut a short length of one of these with a 6 pin connector on the end as the feed for the rigs plug. I wired 3 wires from this feed to a 4 pole 3 position switch as my constants. For the hand mics connections I wired SW1, MIC IN, and Ground to the switch (these would be pins 1,2,and 3 when looking at the back of the 6 pin connector from left to right) and bypassed +9v, N.C. because there was a wire there in the hand mic, and SW2 direct to the front panel connection. Now for the FUN part. Here is where it gets interesting. For those of you who want to roll their own adapter it can be done here. For the wire that is to be hooked in the place of SW1 place in parallel a 21K resitor and a tatalum capaciter. The only thing printed value wise is 102 on my adapter. Connect the free end of the resister to what ever would be your key wire in the mic you plan to use. For the MIC IN (audio in) wire it to the correct pin. Wire the last wire (ground) to it's appropriate pin with the free lead of the capaciter. Instant adapter!!! AT this point you will be able to wire what ever mic you chose to and you can swap between the mic you are working on and the stock mic for instant comparisons there are tons of variations on this connection but if you wanted to plug your Heil headset directly to the switch box WITHOUT the need for any adapter at all You will need a 1/4 inch MONO ( RS CAT # 272-252 2 for 1.99) or an 1/8 inch mono panel mount phone jacks if you use an adapter for the PTT and a 1/8 inch MONO plug panel mount phone jack (RS CAT # 274-251 3 for 2.49) using the same wiring as above hook the 21K resistor to the hot section of the 1/4 inch plug and wire your MIC IN to the hot or center pin of the 1/8th inch mono plug. Tie the 2 grounds to the capaciters free lead and away you go! Again as I said the variations are endless but I touched on the Heil one as I know that many of you are using the Heil mics.

I coverd a lot of stuff above and if there are any questions please
feel free to email me and I will clarify any points that you wish.

I don't know if this subject has been covered before, but here goes anyway.

I want to use my FT100 in 3 areas, from home, in the car daily and also in my Motorhome (RV).

I don't want to pay 30 UKP for each of the DC cables, so has anyone come up with an alternative method.

Thanks in advance.

I believe Radio Shack has 6-conductor RJ-12 modular phone plugs. They most definitely have a 6-pin wall socket, so you could merely make a short plug-to-socket extension, and plug the mic into the wall socket. They even have, I believe, a 6-pin joiner like the mic extension cable, so you could have more of a pigtail effect.

Paul,
WWW.POWERX.COM has an alternative to the Yaesu cord. In fact it is listed (or was the last time I checked) under an area of FT 100 only adapters and accessories. Give them a look see first. I would reccomend that you do not use any connectors that are rated at less then 25 amps. The FT 100 draws (mine does anyway)at least 20 amps on 2 mtr fm 50 watts and as much as 22 amps at voice peaks on SSB on HF and VHF. The ones that Radio Shack sells rated at 20 amps will not hold up under this kind of load fof very long. They tend to get VERY VERY hot and in some cases melt under prolonged usage. The ones at POWERX will demand that you cut the power cable some where. I would also recommend that you have a 30 amp fuse in line ON BOTH THE GROUND AND THE HOT leads on each of the other 2 cables you build. I would also recommend that if the power lead is to be longer then the original Yaesu cable I would use 8 gauge wire rather then 10 gauge. The reasoning for this would be to make sure you are getting the righ amount of amperage and have the lowest possible voltage drop from the battery to the rig. If the voltages drop below 13 volts the FT 100's RX seems to suffer and at 12.5 volts it is very noticeable, at 12 volts the rig is all but usless
GOOD LUCK AND 73

> apart is there anything I should watch out for.
> KC8NST

Simply remove the screws that hold the back on, then remove the one that holds the switch in and the screws for the circuit board, gently remove the mic element from the holder, then remove the baffle and poke open the third hole, reassemble. I did mine a while back so if I missed something, let me know. This will make the audio awesome. You can leave the baffle in if you like, simply turn it until the holes in the front of the mic case line up with the baffle cutout, this is how mine was modded.. Night and day and no other mic will be necessary.. Regards.. Richy N2ZD

Forget the processor, I busted pileups with the mic gain set for 63
and the tx dsp set for dsp1, thats it.. The mic (when modded) will
pick up no additional road noise. I had this setup in my Honda accord
with a "saggy" drivers window regulator and never a complaint about
road noise. Just do what we say and dont ask any further questions..
:-) Regards and Happy audio from Richy N2ZD

the Yahoo groups and all I ever see is problems with this radio as in the FT100D. I love Yaesu gear and own the FT1000D for my HF station and was hoping to buy the FT100D with the ATLAS antenna system. But will the real radio stand up. I mean no offense to anyone who owns this radio but I see a lot more problems than pluses and even with the units after May 2001. Am I missing something or is this radio still having problems and users are just putting up with it and finding ways to modify the radio which voids the warranty!!! I mean every time I get a new post, there seems to be a new problem and gosh I don't want to buy an Icum and mean Icum 706 of any kind. Please guys help me out here and tell me the real truth, no matter how much it hurts, ooooooooohhhhhhhh and hi hi...LOL. 73, Steve

Yes Paul I do have another idea and that is to look for a UK ditributor for Anderson Power Pole products. They have exactly what you are looking for. It is the product the Powerx had on their web site by the way but I had forgotten the name.

# 12591. RE: [FT100] Re: Full power and Processor - Help(mic mod)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-27 02:24:56 UTC
From: Tom Tishken KD4WOV
Topic: 12538  Message: 12591

I usually don't use the processor, just wanted to know about additional road noise pick up. This is the same mic that is on the FT-8100 and I have been eyeballing both mics and I thought the hole was plugged. On my MH29b the LCD speaker mic for the FT-530 the hole was there but not all the way through. the audio had to come through the speaker to get to the mic, I found that out after fighting with muddy audio from the mic and I opened it up. I guess they forget about mic holes in mic quite often.

> the mic pick up more road noise when the baffle is removed and the 3rd hole
> opened up?

Forget the processor, I busted pileups with the mic gain set for 63 and the tx dsp set for dsp1, thats it.. The mic (when modded) will pick up no additional road noise. I had this setup in my Honda accord with a "saggy" drivers window regulator and never a complaint about road noise. Just do what we say and dont ask any further questions.. :-) Regards and Happy audio from Richy N2ZD

Remember, that in most cases, the people with problems are very vocal about the problems, people that dont have problems dont say anything. I am not saying that there are not problems with the FT100, but I suspect that only a minority of people are having problems. I have owned my FT100 for about a year and bought it used and I have not had any problems.

Get the 706. The FT-100D is not user friendly. You have to make a few mods to get it right. So unless you're looking for a superior noise blanker, a superior receiver in terms of overload and adjacent channel rejection, variable bandpass DSP for superb CW contesting, the ability to tune above 470 MHz and a real cool looking rig, I'd go for the 706. The 706 is like a reliable Chevy NOVA. Its performance is kinda limited but it's just plain reliable. The FT-100D is the superior performer but you will spend about 3 months learning how to drive it, plus you have to make the two internal mods and the mic mod to really get it right. And you have to buy the AM filter to run AM. And the Instruction Manual is lacking a lot of basic info. See how someone just posted a question on how to set up for basic AM operation. He shouldn't have to ask that question. I like my FT-100D and I'd probably buy it again since I like CW op and I like monitoring above 470 MHz. It's just a pain to get to know the rig.

Steve

Remember also that the people with the problems may also be the people who have to pay for the repairs!

I have no facts as to the number of people that have had problems as a percentage of the total customers so it is impossible to draw any conclusions, all other statements are meaningless. I suspect that the governments of the world are run by aliens but I have no facts if you get my drift.

Go read the IC706 reflector and talk to lots of friends if you can and draw your own conclusions. Personally I like my FT100 especially with the ATAS.

I hope they mend it soon!

Howard I don't just see a few of them I see a lot of them and they are the same problems and too many not to have some truth to them!!! I mean no offense but the biggest was is a overheating problem that requires a diode to be placed in the fan wire. I mean what is up with that. If the radio has a problem like that it should be fixed by Yaesu. If you cut and modify a radio under warranty, you know as well as I do you can kiss the warranty goodbye. I appreciate the feedback though but there has to be something to this for so many people to be having and reporting the same problems over and over. 73, Steve

I don't know if this subject has been covered before, but here goes anyway.

I want to use my FT100 in 3 areas, from home, in the car daily and also in my Motorhome (RV).

I don't want to pay 30 UKP for each of the DC cables, so has anyone come up
with an alternative method.

Thanks in advance.

Steve,

I think you'll find that a large percentage (not all) of the guys who have had trouble with the FT-100 have either opened it up to "modify" it or don't have a clue what proper mobile, or fixed, installation techniques include. This list is an area to learn and share good operating practices, but there have been many mistakes made before they actually get on here and blame the radio for various failures (like it won't put out a full 250 watts under water on 11 meter AM ;-). I am one of many, many owners on this list that has had zero problems with my 20 month old FT-100 and have operated the pants off of it in HF CW/SSB contest, HF CW/SSB ragchewing, PSK31, RTTY, 6M CW/SSB and UHF/VHF FM ragchewing, both mobile and fixed. I've gotten great audio reports WITHOUT the need to poke out the guts of my microphone and my CW note has always gotten good reports. I love the flexibility and features tucked into that tiny little box. I've only opened it up one time to adjust the CW sidetone. Is it 100% perfect...no, it is a piece of electronic equipment and can fail with or without abuse, however, if you operate it within the parameters that it was designed for, I think you'll find it to be an extremely worthwhile investment that will bring you many hours of enjoyment wherever you go.

Have fun with your decision!

From: Booker, Andy
Topic: 12601  Message: 12601

Have had them both (original FT-100 and ATAS-100) and used them in two SUV's going on 3 years now since they came out. No mods! Still going strong! Using them in the cold and hot humid Atlanta!

Never have had a problem.

Will probably do a clean / degrease the antenna and do the heat mods on the fan this summer for maintenance. Love this radio! Get one, I'm sure some of these people who hate them will sale theirs to you cheap.

FWIW, I have had the original FT-100 and the ATAS antenna in my Chevy Blazer for over two years. It has worked perfectly since day one and the ATAS never stops amazing me with how well it works for it's size. I have received lots of unsolicited reports of how good the rig sounds, and have worked all over the world on a regular basis with this little rig. Compared to the Icom 706 I had prior, this rig has it beat "hands down".

I think that a big part of the problems people experience with this rig are due to "pilot error" and/or poor installation practices. Like any product, you always hear from those with a problem, but rarely hear from those that are happy with the product. This tends to throw overall public opinion out of context. However, I know of six other local hams who also run the FT-100 ATAS combo, and none of them have had anything but praise for the rig.

No matter how you cut it, considering the number of rigs sold versus the number of complaints, you still end up with a product with a less than 5% failure rate - which is great for any retail consumer grade electronic product.

# 12603. re ft100 problems

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-27 17:10:12 UTC
From: ken cubilo
Topic: 12603  Message: 12603

I don't see what the big deal about the rig is. There is a very simple way to install the mods and make them easily removal without sending the rig to yaesu. The mod involves about 15 min of labor maybe 30 min if your no used to working on gear and gets the same results the factory one does without having to send the rig in.

Steve,
The FT-100 is one of those rigs that comes along every once in a
while...that really gives a company a "black eye!" I like my (SWR and fan
modified) FT-100 much better than the 706 I had, but I could not really
advise anyone to buy one. Especially with the RF module failures that are
now beginning to occur! Too bad.
By the way, Yaesu is getting more bad press on their latest duo-bander,
and that wideband scanner/receiver. Check the eham reviews on those units,
FT-100 users, and you'll find we are in good company.

OK guys how about a poll right now instead of blindly saying that a large percentage of the FT100/D problems were caused by people modifying their radios.

How many who had the blown V/U finals for instance #1. modified the radio themselves and #2 how many were just using it for casual operation or just receiving and then went to V/U tx and found the final FET had croaked.

Mine had the fan mods and VSWR mods but still died and I wasn't even txing so to go and say that performing mods to the radio is the cause of most of the problems may not be correct.

and #3 How many had out of box failures where the -9 volt converter died the 2nd day of ownership.

#4 How many had the VHF/UHF pre-amp die even after the VSWR and fan mods had been performed.

Mark me for number 2, 3 and 4.

With all due respect, I wonder where you got this number.
If this is true, the normal failure rate for ham rigs in general must be
.05%!
Although I much prefer the FT-100 to the 706, I am enough of a realist to
understand that there are tons of problem comments all over the web and
the bands about my FT-100, and very very few about the
operationally-inferior-but-better-QC ICOM 706. The ostrich-like attitude
of some hams is perplexing...we did not design the rig, we make no money
off it, it is not of our family...If you have no personal stake in it,
please face facts.

Not true,

in the consumer and commercial electronics world even a 1% failure rate is considered poor workmanship standards and not looked at in a positive light except maybe by Yaesu.

When I started on the list my first post were positive as some of the early members may remember but after a while, only a few days of use, the problems started even after VSWR and fan mods had been performed on 2 radios. The radios were both grounded at both antenna and radio ends, and I never left my radios in the on position when the car engine was turned over, I did all of the typical walking on egg shell things that a lot of us were doing to overprotect the radio but even these steps were of no help, @#%$ still happened. Also keep in mind that a good number of past list members have sold their FT100s and going to other things and therefore unsubscribed from the list out of total frustration with the radio. I knew of a few members who had their radios sent back several times for the same warranty work after which they finally got rid of the headache and were never heard from again. It's only a matter of time before we all eat our words.

No, not a poll right now here on the email list, please. Go to the Yahoo!groups page for he list and create a poll. Much better, allows tabular response gathering and everything.

Thanks

Interesting....Motorola told us to expect a 1% failure rate on our new
800Mhz Astro digital trunking system. We've experienced more like a
10% rate. This with over 15,000 radios (mobile and portable).
